# 1 Introduction

Welcome to RCM Ultimate, the ultimate software for time-keeping and race management. RCM Ultimate is the optimal solution for clubs or single persons to organize all race-events from a small club race up to a World Championship.

Performance survey:

- \* driver administration including statistical information, club membership and team affiliation
- \* drivers license administration
- \* database for country codes, frequencies and federations
- \* extensive setups for the rules
- \* automatic and manual arrangement of practice and qualification heats as well as the finals according to different criterions like the drivers skills
- \* semi automatic creation of time schedules
- \* extensive control instruments during an heat
- \* administration of penalties and warnings
- \* results according to laps and time for practice, qualification and finals
- \* best time in practice and qualification
- \* point system in practice, qualification and finals
- \* automatic arrangement of the finals according to electric and I.C. rules
- \* several lists of participants including lists with and without frequencies and transponder numbers
- \* team results
- \* several different ranking list
- \* results including lap times
- \* championship management including results
- \* data archives
- \* data import and export including an interface to other programs (for example MS Excel)
- \* automatic voice announcements
- \* manual and automatic sequence control
- \* automatic control of a second time keeping system

The concept of RCM Ultimate is a server-client architecture. To avoid that RCM Ultimate is overloaded with complex and partly customer specific needs special functions not related to the time keeping have been realized in client-programs, which connect to RCM Ultimate. To use these clients you have to install a network. RCM Publisher (result publishing in the drivers area), RCM Voice (separate Voice announcements), RCM Signal (signal control) and RCM Registration (administration of drivers data) support RCM Ultimate and can help you with the race organization.

## 2 Installation of RCM Ultimate

RCM Ultimate is delivered as executable setup-file. Installing RCM Ultimate the first time you have to use the full version. Otherwise you can use the update-version. To start the installation you have to run the setup file (double click in the Windows Explorer on the filename like "RCM.Ultimate(v1.4.5.123-F)" or use start/run of the main menu of Windows). Before you run an update we recommend to you to make a complete backup of the RCM Ultimate folders. Please do not delete these folders or delete files in it.

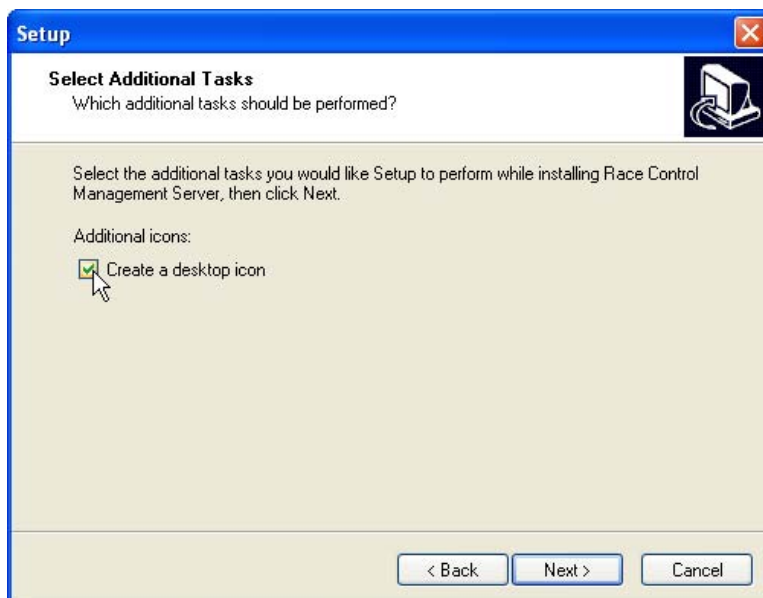

Please note, that the update version is mostly newer than the full version. If you install RCM Ultimate the first time you should run an update directly after the installation.

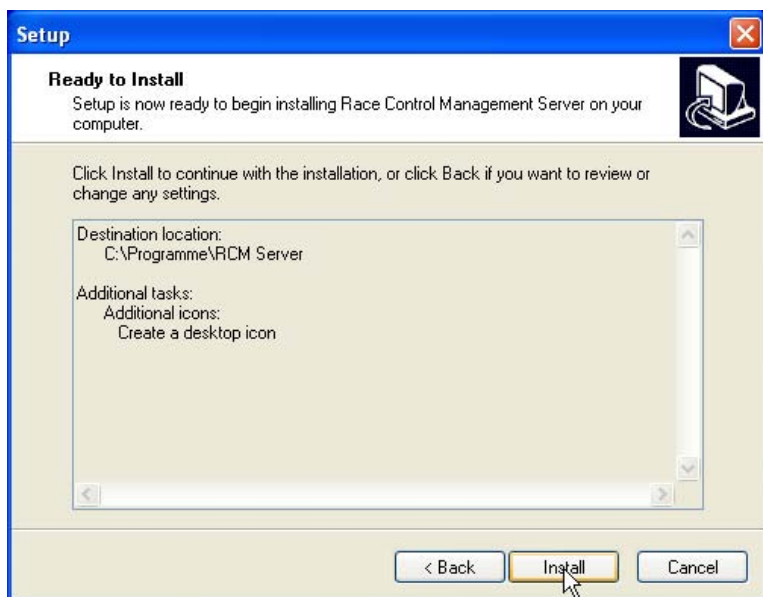

After the welcome screen (please click here on Next), the next windows shows you the destination folder. Preferable this is C:\program files\RCM Ultimate. You should not change this except for special reasons.

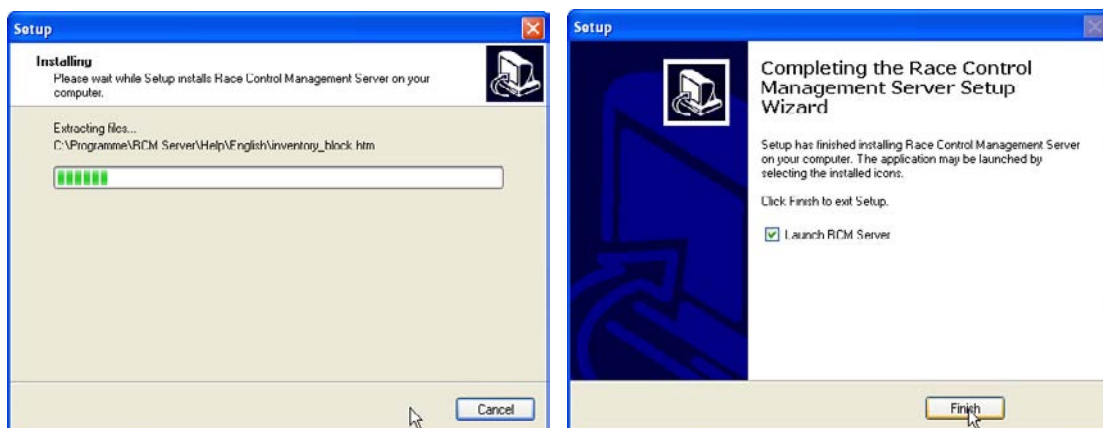

Again you click on next and in the following window you can determine whether setup creates an icon on the desktop for starting RCM Ultimate.

The next window shows you a summary of the actions setup will execute.

With clicking on Install you will start the setup process.

## 2.1 Registration

To activate the program you need the contract number, the serial code and the access code. You have received these information with your order from RCM. Launching the application the first time you have to type in these information before you can use the program.

The image shows the 'RCM Registration' dialog box. It has a blue title bar and a white background. It is divided into two main sections: 'Registration Data' and 'Contract Data'. The 'Registration Data' section contains two input fields: 'Serial Number' and 'Access Code'. The 'Contract Data' section contains one input field: 'Contract Number'. At the bottom right, there are two buttons: 'Ok' and 'Abbrechen'.

The application language is set to English by default. For changing this language please refer to Settings/Language later in the manual.

## 2.2 Compatibility to older versions

All RCM versions are compatible backwards. Choosing an event run with an older version of RCM Ultimate, the currently installed version will upgrade the database and will add all necessary configuration files to run the event with the current version properly. You can not use these upgraded data with an older version of RCM Ultimate.

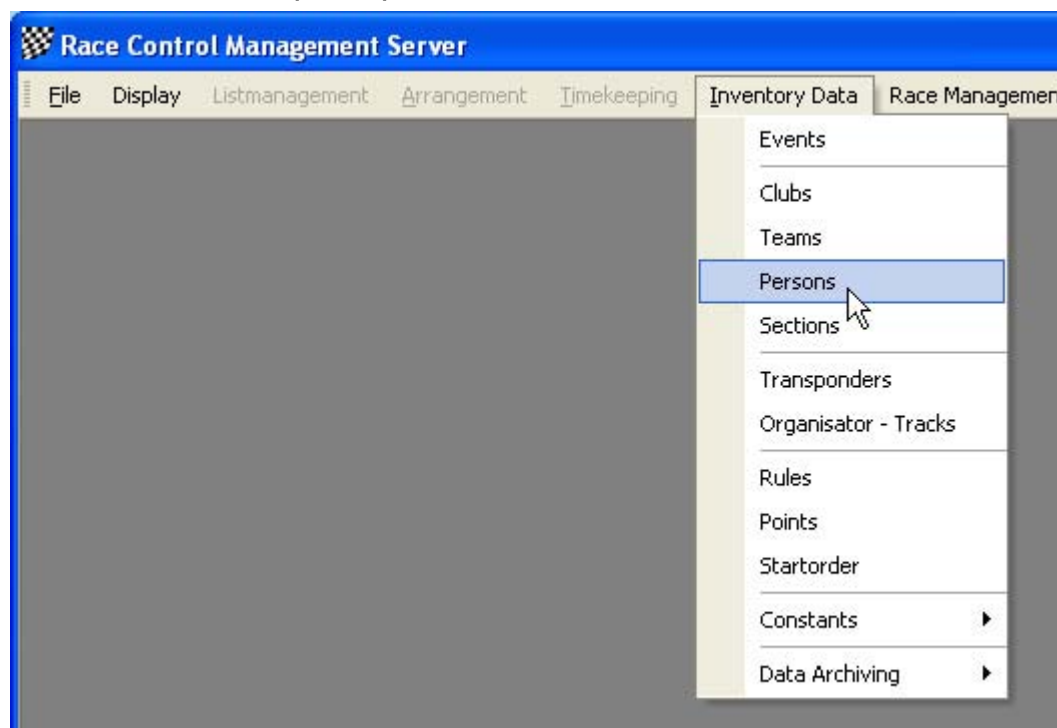

## 3 First steps

RCM Ultimate is very user friendly and you will be familiar with the handling quite shortly. Before you can use the program it is necessary to enter some data needed to race an event. We recommend that you follow this chapter first.

### 3.1 Inventory data

The data managed by RCM Ultimate relate to each other. Therefore it is important, that all basic data has been entered before you can start a race event. Please refer to the appropriate chapters in this manual.

- \* Does this race is ranked with a championship?
- \* Which rules are needed?
- \* Which sections will be run?
- \* Who is the organizer and on which racetrack will be run?
- \* Which transponder set will be used?
- \* Which drivers will participate?

#### 3.1.1 Which Championship

You need a point schema before you can rank a race with a championship. This schema describes the number of points a driver gets for the championship result according to the ranking of the race.

### 3.1.2 Which rules?

We recommend that you create a rule for each section. This rule describes the complete race format. You define the arrangement of the heats, the qualification, the race time, how the heats and finales will be ranked and how the finals are run. Part of the rule is also the point schema for a championship.

### 3.1.3 Which sections

You have to enter all sections needed. If a section does not exist, you have to create it. It is important to assign the appropriate rule to a section.

### 3.1.4 Which organizer, which track

You have to enter the organizer and the corresponding race tracks. This is usually your own host-name of the organizer, host club or federation. You need to assign one track for minimum. You can add as much tracks as you want if your track has a flexibility in length e.g. or your club uses several race tracks. Please note, that you can not create a event without at least one organiser and one assigned track. Without a track you can not add drivers to the driver list.

### 3.1.5 Which transponder

If the organiser uses handout transponders beside the personal transponders for drivers who have no personal transponder, the transponder numbers have to be entered. RCM Ultimate recognize, whether it will be a personal or a handout transponder.

Handout transponders can be used on two different ways. If the transponders are given to the drivers in each heat (by their number), you have to set the transponder set to active. If the transponders are handed out for the whole day, the transponder set have to be set to INACTIVE. In this case, we are speaking of temporary transponders. These have to be entered in the driver data as temporary transponder in each section. There is a routine in RCM Ultimate to delete all temporary transponders in the drivers data. This will normally done at the end of the day after the race.

### 3.1.6 Which drivers

Each driver must be registered at least with his name (the other data is not necessary). Further on, you have to assign the appropriate section to the driver. In the section data, the frequency and the transponder numbers must be entered. If driver is already registered and assigned to the section which will be run, he can be easily added to the driver list of the event. If you add a driver not assigned to the section which will be run, this section will be automatically assigned to the driver but you have to enter the section data (frequency and transponder).

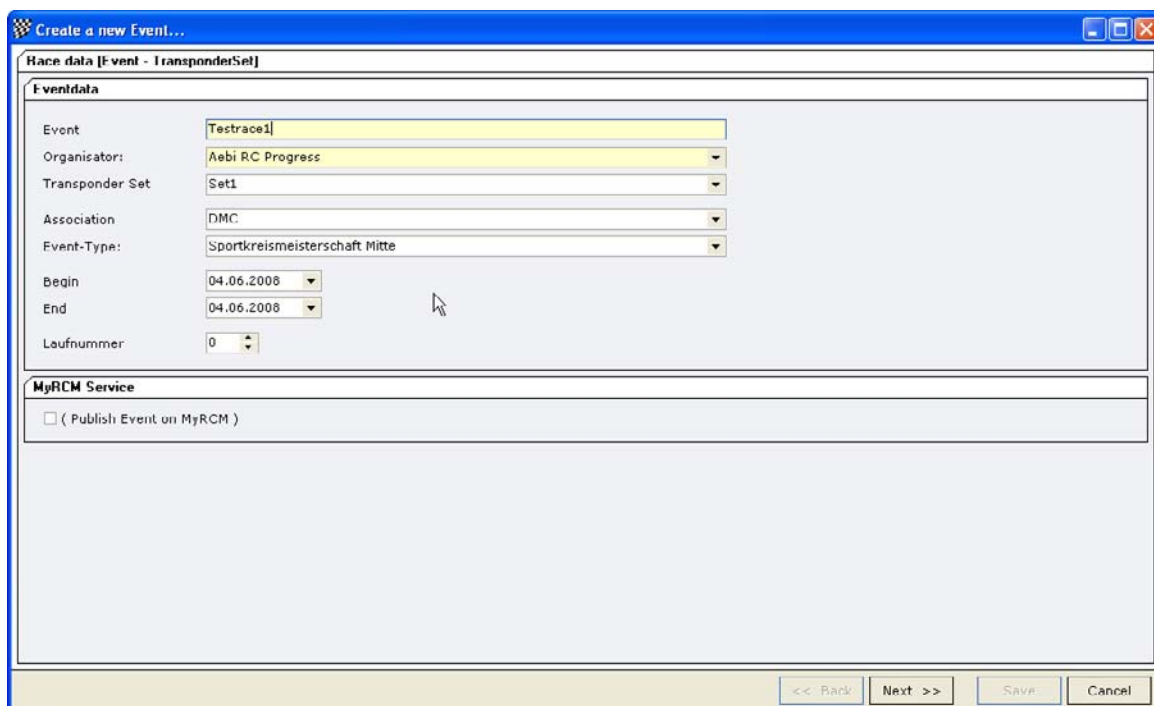

## 3.2 Setup a race

### 3.2.1 Create a new event

To create a new event you go to the file menu and then new event. A wizard is started which led you through all necessary details.

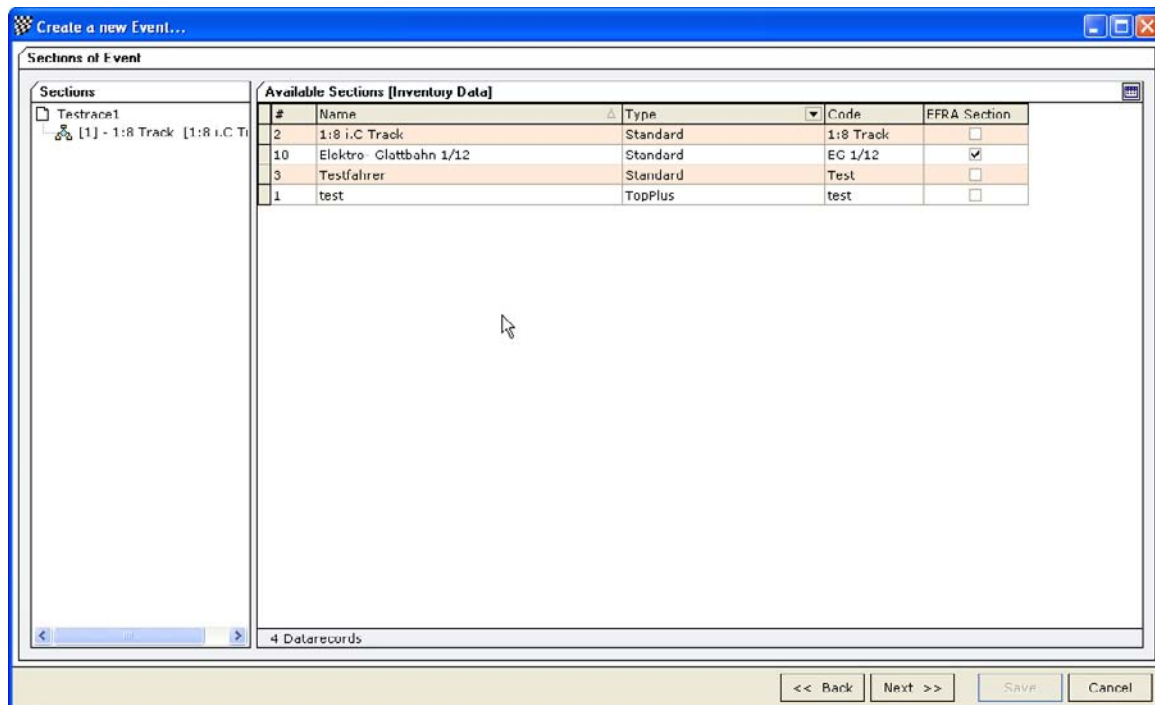

First you have to enter the name of the event, the organiser, the transponder set, the federation, the event-type, the date of the event and the number of the race in the championship.

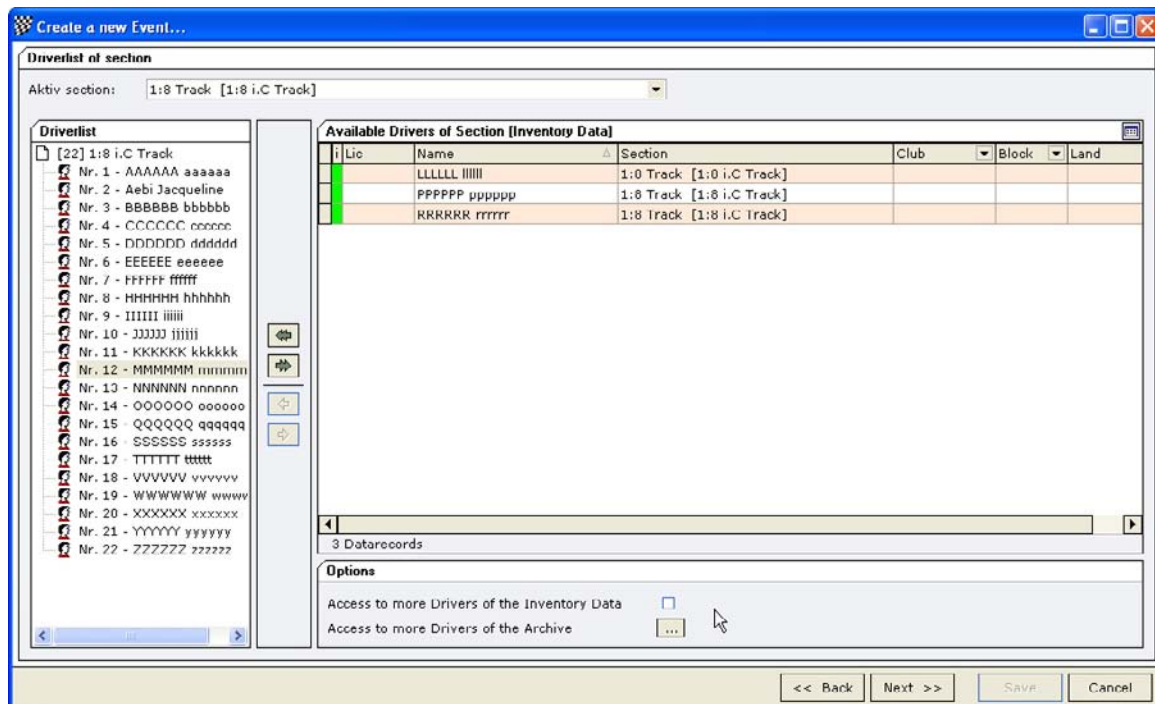

You can only enter an organiser already registered. To choose one of a list, click left on the arrow at the input box. You see a list of all registered organizer and you can choose one with a mouse click. You can do the same for the transponder set, the association and the event-type. The event-types are entered in the inventory data/ constants/associations. Further on you can select if the results will be published on MyRCM. Please activate this function only if your time keeping computer has access to the internet. Finish this window with clicking on next.

In the next window you will be asked for the sections. In the right column of the window you see all sections already entered in the inventory data. If you double click on a section, it will be added to the list of sections of the event.

If a organizer has more than one track, you will be asked on which track the race will be held. If you want to remove a section from the race, just click with the left mouse key on it, hold the key pressed and draw the section into the right column. You can also use the arrow-buttons in the middle of the window. You finish this window by clicking on Next.

Now, you have to add drivers in each section to the driver list. On the top of the window you first have to choose the active section. Please note, that you add drivers to all sections of your event.

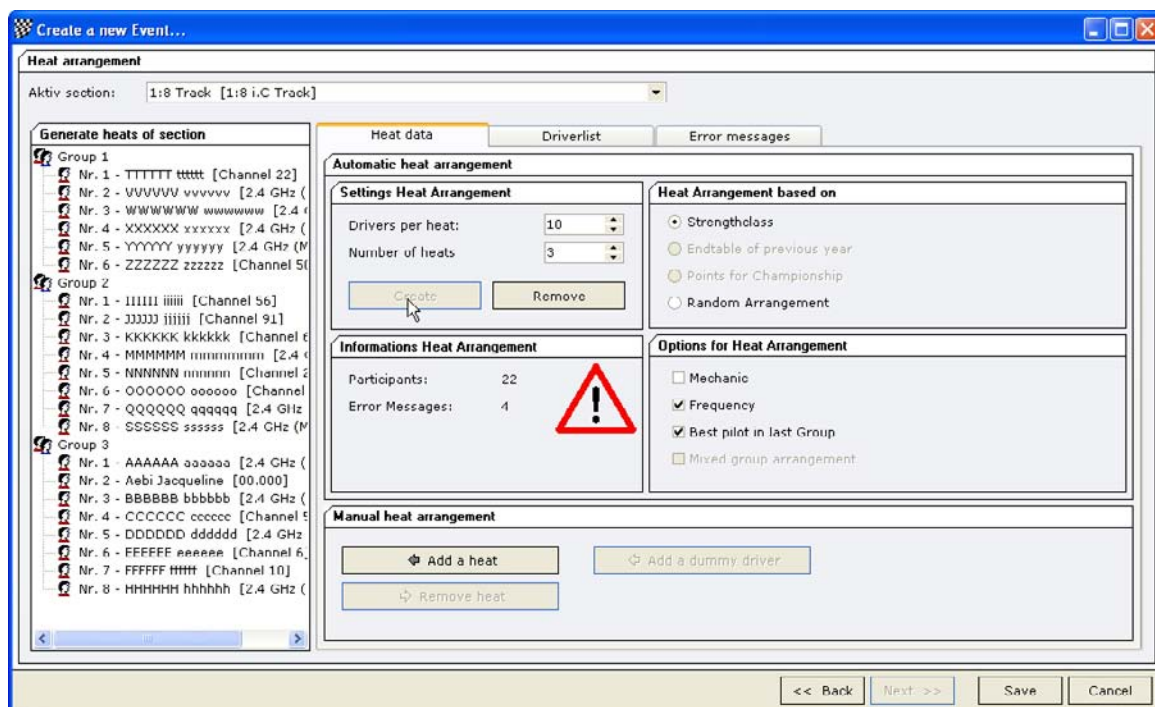

You see the drivers already assigned to this section in the right column of the window. These drivers can easily added to the driver list. If you miss a driver, you expand the list by activating "access to more drivers of the inventory data" in the lower part of the right column. You have also access to more drivers in the archive. Click on "..." button and a new window opens, giving you access to the archive of inactive drivers which you have created under inventory data/data archiving/persons.

If you add a driver not already assigned to this section from the inventory data to the driver list, the section will automatically assigned to the driver. Please note, that you have to enter the frequencies and the transponder number in the section data for such drivers. If you have added all participating drivers to the driver list in all sections, finish this window by clicking on next.

The next step is the arrangement of heats. This can be done automatically or manual. You have to arrange the heats by section and you have to choose the required section on top of the window. First determine the number of drivers you want to have in each heat.

By clicking on the create button the arrangement will be done automatically in respect to the frequencies. You can see error messages (frequency problems) by clicking on the errormessages tab. The tab "driverlist" allows you to move single drivers from one heat to another.

Remark: When you create a new event, the arrangement of heats for practice and qualification is the same. If you change the practice heats afterwards, this changes do not automatically affect the qualification heats. If you want to use the same arrangement of heats in qualification as you used for practice you have to copy the practice heats to the qualification heats, This is done under arrangement/qualification and then use heat arrangement based on the heat arrangement practice.

Please finish your work by clicking on the save button. Changes can be done later. You can add drivers for example even when the race was started. With this step you have finished with entering the necessary data.

### 3.2.2 Open the race overview

After you have finished the arrangement of heats and you have solved all frequency problems, you can start the race heat by heat. For this purpose you open the racing grid through timekeeping/qualification.

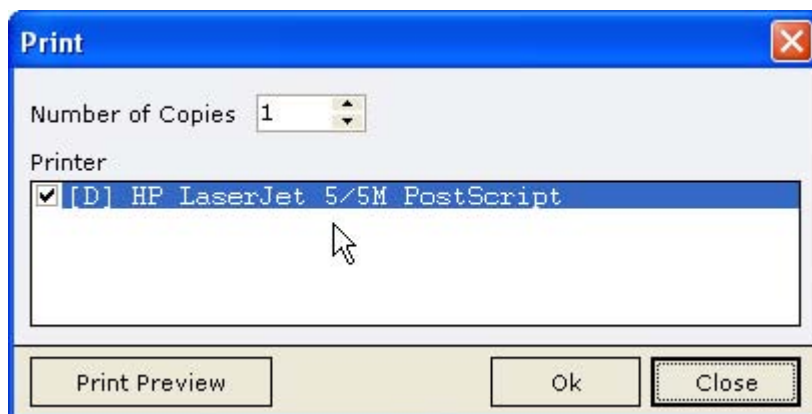

### 3.2.3 Start the race

After the race grid is open, you see in the right column the heats. You can select one just by clicking on it. Now the drivers of that heat are displayed and you just have to start the race and wait until the time is over. After the race is finished, click on finalize race.

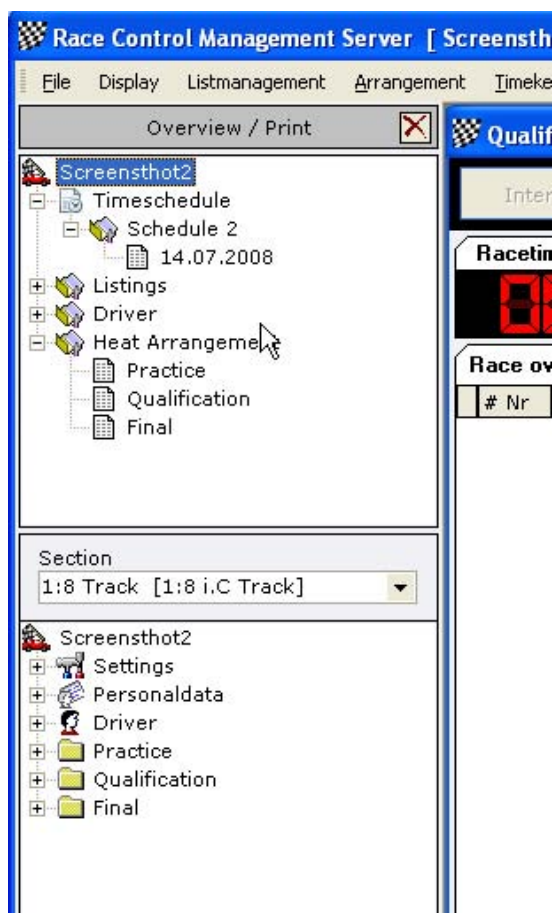

The results are saved and you will be asked to print the results (please note, that you must have selected a printer in settings/interfaces).

Now you can start the next heat. If necessary you can correct the results after a heat.

### 3.2.4 Print results

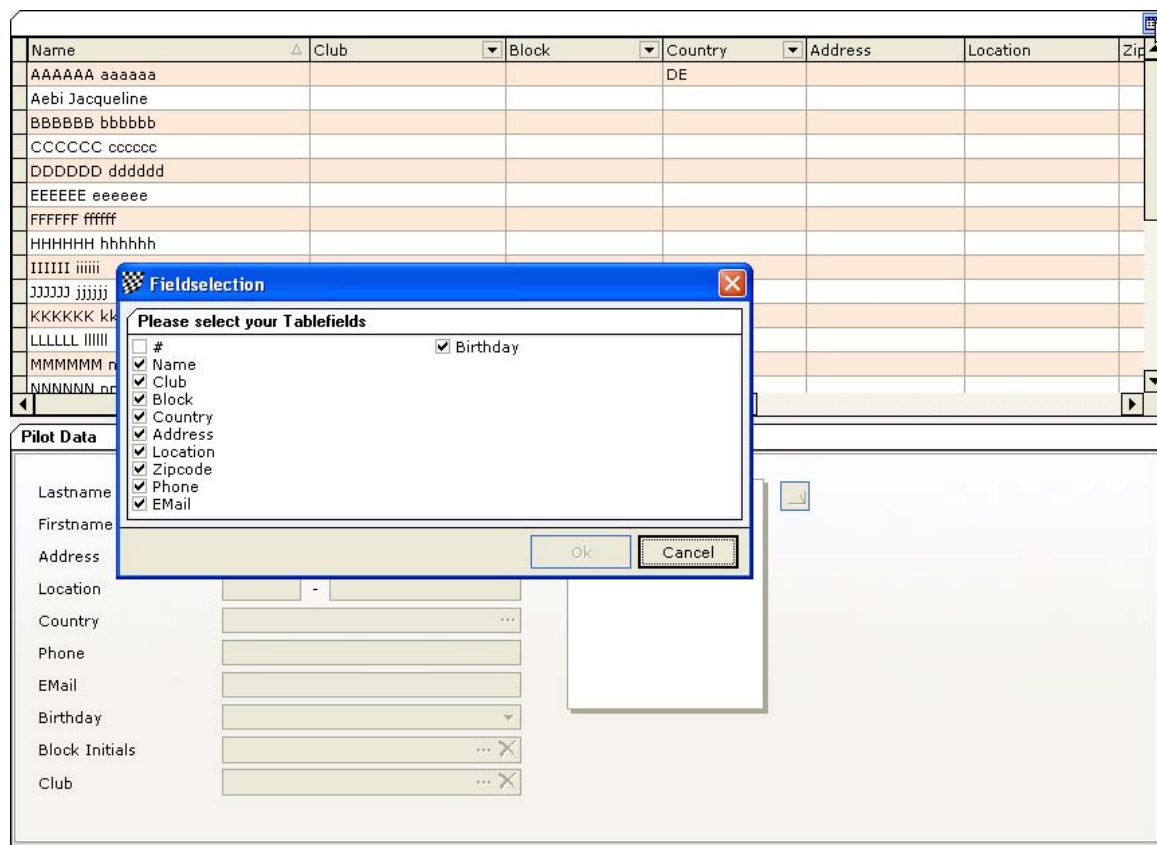

By pressing the function key F2 or by using the menu display/overview you can open a special menu for printing. You can print all available reports. Extend the required region with the mouse and then you can select the item you need. By clicking right with the mouse a submenu will be opened which allows you to see a print preview or to go directly to printing. Please note, that you can only print reports, which have generated automatically (for example after finalizing a heat) or manual.

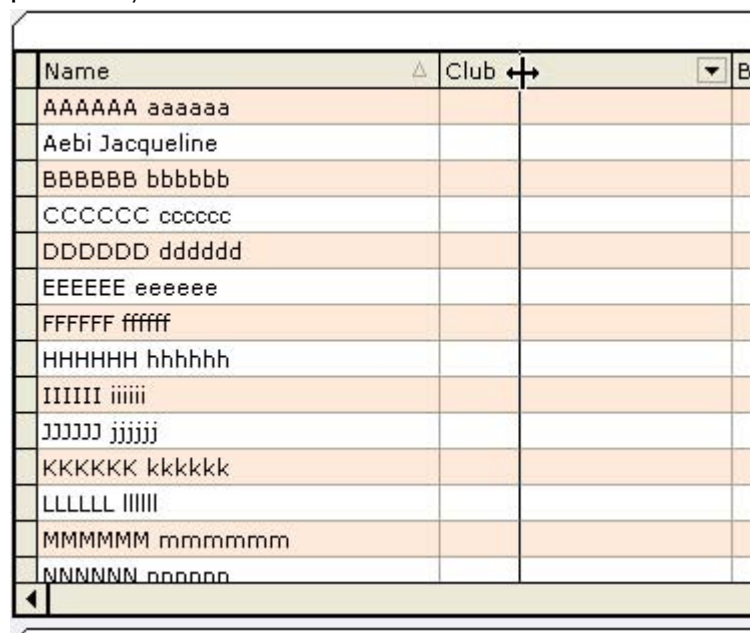

## 4 Basics to the handling of the program

### 4.1 Display of fields in tables

In a lot of table views you will find a button in the right upper corner. Clicking on that button allows you to select fields shown in the view of the table. Just activate the fields you want to display (and inactivate the fields you do not need) in the window which is opened when clicking on the button.

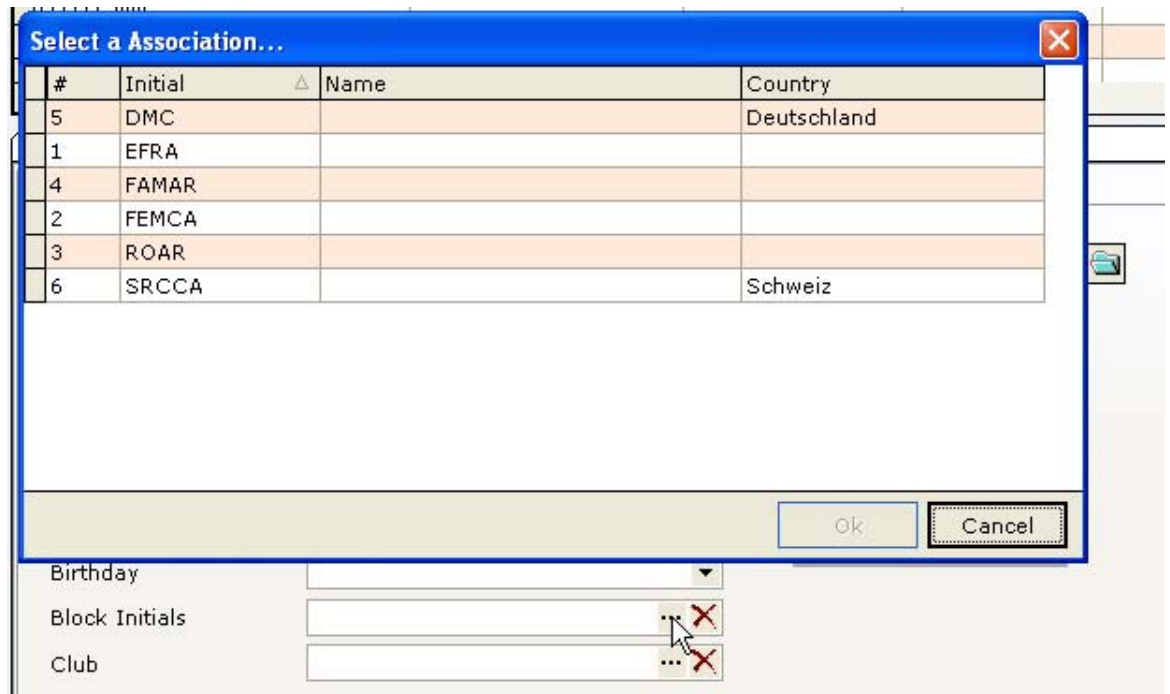

The width of columns in tables can easily adjusted by clicking on the parting line in the header of the table. Hold the mouse key pressed and move the line to the position you need.

## 4.2 Input fields

At the right end of several input fields you will find a button with an down arrow or with three dots. By clicking on this button, a list of all available data of the inventory items will be displayed. You can easily select the item needed by clicking on the appropriate line.

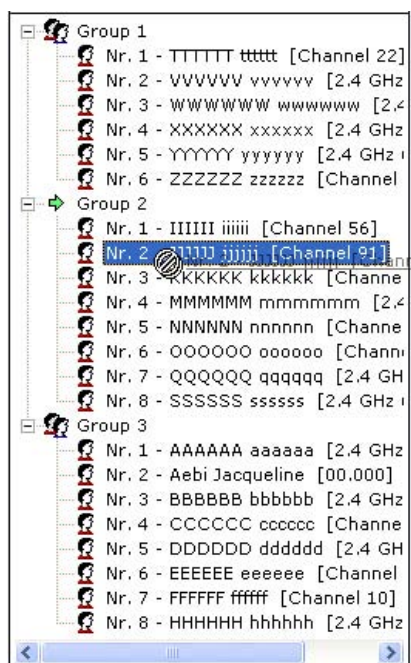

If you find a button with a cross, all data in the input field will be deleted if you click on that button.

Input field where an input is mandatory are marked with a light yellow background.

## 4.3 Drag&Drop

The drag&drop-function of windows is enabled in several windows, when useful. This means you can move elements simply by left-clicking on them, holding the mouse key pressed, moving the element where you want it, and releasing the mouse key.

## 4.4 Search function/navigation in tables

Tables, which are bigger than the window they are displayed in, have a search function enabled. To activate the search, you just click somewhere in the list and directly after you type in the search item. The search text will be displayed in a yellow box on the margin of the table.

Name	Club	Block	Country	Address	Location	Zipcode
HHHHHH hhhhhh						
IIIIII iiiiii						
JJJJJJ jjjjjj						
KKKKKK kkkkkk						
LLLLLL llllll						
MMMMMM mmmmmm						
NNNNNN nnnnnn						
OOOOOO oooooo						
PPPPPP pppppp						
QQQQQQ qqqqqq						
RRRRRR rrrrrr						
SSSSSS ssssss						
TTTTTT tttttt						

mmmmm

The text typed in will be searched as part of the text in the data records. This means that if you for example search a name in the table of persons, which can also be a first name, the first data record with the first name will be displayed. If you want to search the last name, than you should add a space after the name.

For a better navigation in the list you can change the sorting. For example: If you click on the column header "name" the alphabetical sort order will be inverted.

Name	Club	Block
RRRRRR rrrrrr		
QQQQQQ qqqqqq		
PPPPPP pppppp		
OOOOOO oooooo		
NNNNNN nnnnnn		
MMMMMM mmmmmm		
LLLLLL llllll		
KKKKKK kkkkkk		
JJJJJJ jjjjjj		
IIIIII iiiiii		
HHHHHH hhhhhh		
FFFFFF ffffff		
EEEEEE eeeee		
DDDDDD dddddd		

If there are down arrows in the header of a column you can also sort the list by this column. Further on you can enter here special sorting definitions. You can also limit the displayed data records to specific entries. By the way, all sorting definitions will be deleted if you close the window and reopen it.

Name	Club	Block	Country
RRRRRR rrrrrr		(All)	
QQQQQQ qqqqqq		(Custom...)	
PPPPPP pppppp		EFRA	
OOOOOO oooooo			
NNNNNN nnnnnn			
MMMMMM mmmmmm			
LLLLLL llllll		EFRA	
KKKKKK kkkkkk			
JJJJJJ jjjjjj			

## 5 File

The file menu contains the administration of the events with

New event ... Create a new event

Load event ... load an event of the archive

Remove event ... delete an event when you do not need it anymore

Close loaded event ... close an event, for example if you want to import data, which is only possible, when no event is open.

### 5.1 New event

This opens a wizard which led you step by step through the necessary inputs for a new event. Before the wizard is started an event in the memory will be saved to the archive and the memory will be reconfigured for the new event. The progress of this process is displayed in a special window.

The screenshot shows the 'Create a new Event...' wizard window. The window has a title bar 'Create a new Event...' and a subtitle 'Race data [Event - TransponderSet]'. The main area is divided into two sections: 'Eventdata' and 'MyRCM Service'. The 'Eventdata' section contains several input fields: 'Event' (a text box), 'Organizer' (a dropdown menu with 'Aebi RC Progress' selected), 'Transponder Set' (a dropdown menu with 'Set1' selected), 'Association' (a dropdown menu with 'DMC' selected), 'Event-Type' (a dropdown menu with 'Sportkreismeisterschaft Mitte' selected), 'Begin' (a date dropdown with '04.06.2008' selected), 'End' (a date dropdown with '04.06.2008' selected), and 'Laufnummer' (a text box with '0'). The 'MyRCM Service' section contains a checkbox labeled 'Publish Event on MyRCM' which is currently unchecked. At the bottom of the window, there are four buttons: '<< Back', 'Next >>', 'Save', and 'Cancel'.

Event: For the name please use the basic description of the event, the main title. You should not refer to a date or a section.

Organizer: Please enter the name of the organizer of the race. You can only enter organizer stored in the inventory data. The track is connected to the organizer as entered in the inventory data.

**Transponder Set:** Usually an organizer owns a transponder set to handout to drivers which have no personal transponders. To work with a transponder set, the name of the set as well as all transponder numbers have to be entered in the inventory data. You can change the name of the transponder set later.

**Association:** If the event is run under an association or federation, the name can be entered here.

**Event-Type:** The type of the event, for example National Championship.

**Begin:** Date of the start of the event.

**End:** Date of the end of the event. If the event lasts only one day, Begin and End is the same date.

**Event-Number (Laufnummer):** If the event counts to a championship, the number of the round have to be entered here.

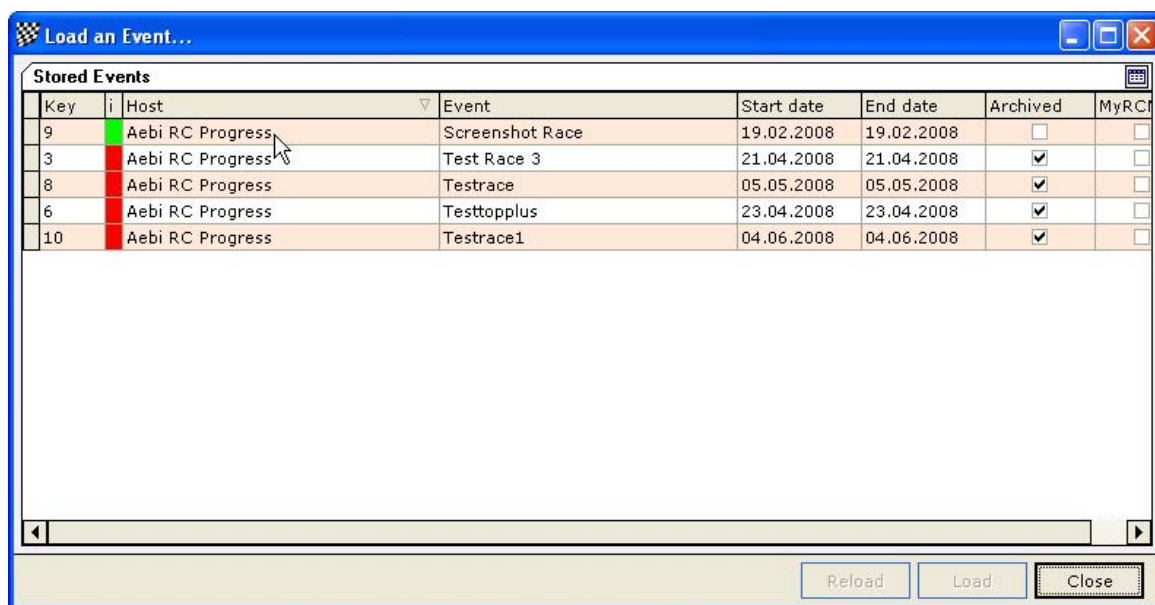

**Publish event on MyRCM:** If the time keeping computer have access to the internet and you want to publish the results on MyRCM, this feature should be activated.

Please note, that further settings in the settings-menu are necessary.

For a further description of the wizard please refer to the first steps section in this manual.

## 5.2 Load event

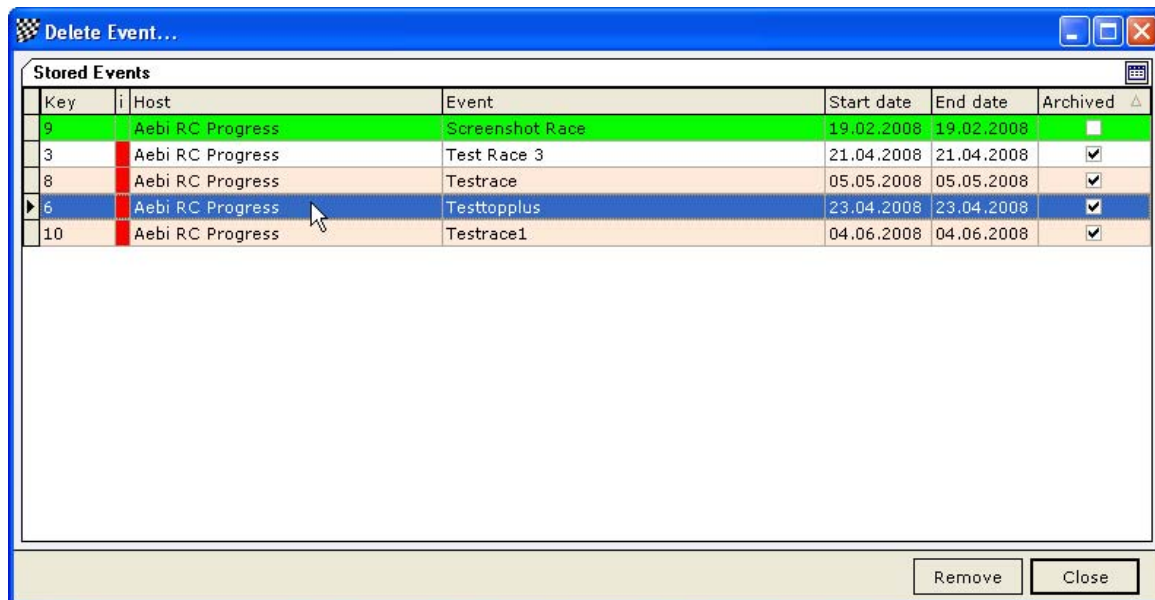

You see a list of all saved events. Double clicking on one of these events will load the event in the memory. If the data is located in the archive (Archive activated), an eventually loaded event will be archived and the selected event will be loaded. The status changes to Archive = No. In between the loading process you will see a display of the progress. You should not interrupt this process. Clicking on the reload button after marking the already loaded event (green in the display) will reload the event from the database into the memory of RCM Ultimate.

After loading an event, the overview/print menu will automatically displayed. You can switch on and off this menu by pressing the F2 key.

### 5.3 Remove event

Again you see a list of all events in the database. You can only delete events which are marked red in the information column. The event with a green background is loaded and can not be deleted. Left click with the mouse on the event you want to delete and then click below on the button remove.

You will be asked if the event really should be removed. If you confirm this question by clicking ok, the data of this event will be irretrievable deleted. The entry in the list disappear. You should use this menu item carefully.

### 5.4 Close loaded event

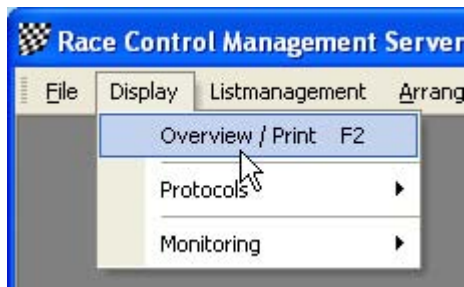

The loaded event will be moved to the archive and RCM Ultimate has the same status like when it is started. This option for example allows to you to import data, which is not possible if an event is loaded.

### 5.5 Close

RCM Ultimate will be closed. A loaded event will be archived and can loaded again after a restart of RCM Ultimate.

## 6 Display

In the display menu the submenus overview/print, transponder logfile and system messages can be executed.

Inside RCM Ultimate special function keys allow you to see more information:

F2 - opens the window of the submenu overview/print

F4 - Opens the transponder logfile

These two function keys refer to the menu display. But there are some more useful function keys:

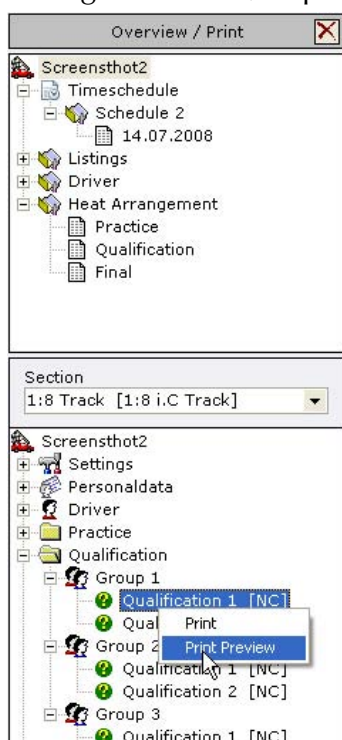

F1 - Opens a help function. If this function key is used within an opened window, it will display the help text especially for the selected function.

F3 - This key is used to switch the search item in tables. In all tables you can use a search function. The search definition has to be entered in a yellow box at the margin of the table. The table is searched in a full text mode. Using F3 you can switch to the next search definition.

F5 - Refresh a table. A table should always display the actual information. In some cases you should press F5 to update the display of the table, the data for the table will be reloaded.

### 6.1 Overview/print

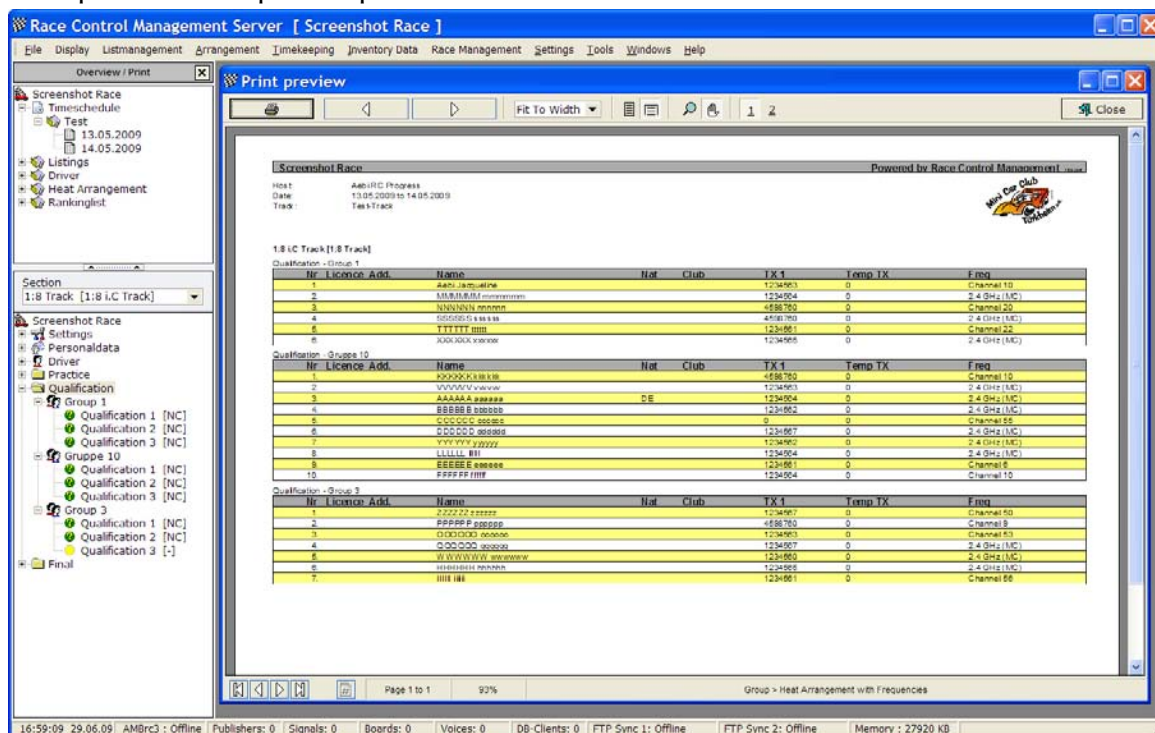

This menu item is only active, if an event is loaded and displays a menu tree in which you see all reports structured. You must have selected at least one printer (see settings/interfaces) to print from that menu.

In the menu-tree you see all items of the event. If one item is marked with a + sign in front you can enlarge this item by clicking left on this sign. If you have selected the item you need, you click right on that item and a submenu is opened. Before printing you can choose if you want to print directly or to see a preview on the screen. In the footer line of the window of the print preview the name of the template used for this printout is shown (please refer to Tools/Templates/Template Editor). When you start printing, you can select on which printer and the number of copies you want to print. The number of copies can be

set different for each printer. Just double click on that printer and select the number of copies for this specific printer.

All reports refer to the section which is selected in the middle of the overview/print window. In this menu you only print the reports which have already been generated according to the course of the race (automatically by RCM Ultimate or manually). The status of the reports is always up-to-date. If you make corrections somewhere in RCM Ultimate all affected reports will be generated or changed.

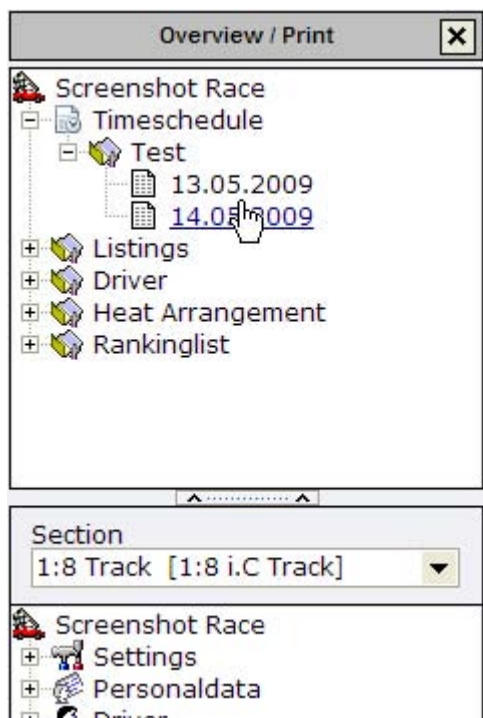

## 6.1.1 Driver list and other static data

Overview/print is structured in the following items:

On top you will find a general part with the time schedules and lists of all penalties and warnings. In the general part you can select "Driver", heat arrangements and rankinglist. Here you can print these lists overlapping for all sections. This means that you can print the lists for all sections according to the sortindex set in the definitions of the sections.

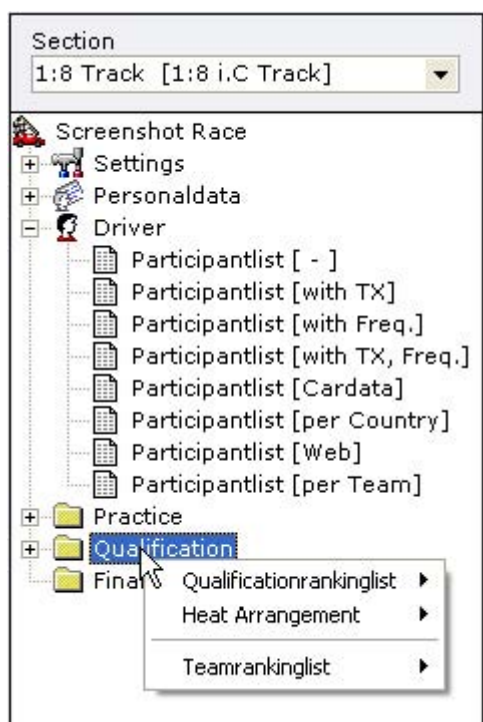

Below are the details of the race displayed. These are selected according to the section set in the middle of the window.

Settings: Here you can print the rules of the selected section for practice, qualification and finals separately.

Personal data: A data sheet for each driver can be printed, selectable by country. Included in this sheet are all particulars of the driver as well as details to the used products (if entered in the inventory data). You should let the driver sign this sheet to be sure that all the details are correct.

Driver: Different lists for the participants of the event are available. The content of the lists can be changed with Tools/Templates/Template Editor. The participantlist [Web] is used for the publication on the internet. The participantlist [per country] opens a dialogue for printing the lists all countries or only a specific one. The participantlist [per Team] prints all teams and the affiliated drivers. If you configure a teamcup, all results are not only referred to a driver but also to the team the driver belongs to.

Practice - Qualification - Final: If you enlarge this item, you will find all single heats. You get the heat-list as well as ranking lists by clicking right on the main item . Results of the heats can be printed by clicking right on the specific heat. You can only print the result of heats which have already been run. Only the results of the selected rounds are printed.

If a subfinal is run more than one time and more than one subfinal is counted, you can print a ranking only for this subfinal.

Description of the signs: A yellow circle means, that this heat has not yet any results. A green circle without question mark means, that the heat has been finished and has been confirmed. A green circle with question mark means, that this heat has finished but has not been conformed.

In some cases (especially if you import the race data from another computer) it is possible that no reports are available. If this happens, please use the rebuild report function in the timekeeping survey. When doing this, the ranking lists will be created too.

Ranking lists: The program generates the ranking lists as soon as race results are available. The ranking lists can be printed by right clicking on the main menu item (Practice, Qualification and Final). For Practice and Qualification you will find a special submenu (manual selection) to print the ranking of the heats in different combinations.

The Eventrankinglist is used for the championship administration and is based on the point schema defined for this championship. Depending on the definitions made in the rule, this eventrankinglist is not only based on the final result but can include the qualification ranking.

Remark: An eventrankinglist can only be created, if a point schema is in the inventory data and this point schema is defined in the rule. You can check this under the menu inventory data/rules on the last page of the rule wizard. The Eventrankinglists can be printed separately according to the drivers skill level and the licence data.

## 6.2 Protocols

### 6.2.1 Transponder Logfile

A window is opened in which all data sent by the decoder is displayed. You can open this window anytime in RCM Sever by pressing the F4 function key.

Index	TX-Typ	Car	Driver	Lap	Laptime	Absoluttime	Transponc	Accu	Hits	Rec Nr
8	Privat	0	-	0	0.000	0:00.000	1234562	2	0	8
9	Privat	0	-	1	11.556	0:11.556	4598760	2	0	9
10	Privat	0	-	1	13.875	0:13.875	1234563	2	0	10
11	Privat	0	-	1	13.975	0:13.975	1234564	2	0	11
12	Privat	0	-	1	13.275	0:13.275	1234567	2	0	12
13	Privat	0	-	1	13.275	0:13.275	1234560	2	0	13
14	Privat	0	-	1	13.275	0:13.275	1234561	2	0	14
15	Privat	0	-	0	0.000	0:00.000	1234565	2	0	15
16	Privat	0	-	1	14.275	0:14.275	1234562	2	0	16

Copy Transponder to Clipboard    1234562    ...    Clear

With the information in this window you can check the connection between computer and decoder. Every time a transponder passes the loop, the data is displayed in the window.

Remark: Before you start a race you should check the decoder as well as the transponder carefully. You can check the transponders just by passing it on the top edge of the front panel of the decoder. Anyway you should also check the loop and the connection from the loop to the decoder.

Information in the log table: In the columns Transponder, Accu, Hits and Rec-Nr information is displayed, which have been received from the AMBRC or AMBrc3 decoder. The columns TX-type, Car and Driver are internal references from the inventory data based on the transponder ID. This information is only available if an event has been loaded and when a heat is prepared for start. Further on the Laps, laptime and absolute time will be displayed.

A significant parameter is the hits. Being a good timekeeper, you should observe this during the race.

Note: If all hits of all transponder passings are yellow or red something is wrong with the time keeping system. This is maybe due to one of the following reasons. The connection between loop and cable is not good.

The loop is damaged.

The loop is too deep in the ground.

The loop is too high over the track.

The distance between the two wires of the loop is too small.

The cars are too fast at this part of the track.

The loop is interfered by another system.

You have to check, that the time keeping system is working properly otherwise you risk, that RCM Ultimate is not able to calculate proper results.

If you realise, that the hits are very low only from one transponder you can be sure that the driver has the transponder not built in his car in a proper way. The transponder must be mounted horizontally and not vertically.

The information in the column Accu is always 2. If the battery of a transponder is empty, it will not work anymore and is not recognised by the decoder.

If a transponder produces a peep (headphones of the AMBRC decoder) when passing the loop and it is still not counted, the RS232 serial configuration in

RCM Ultimate may be wrong. Please check if the cable between computer and decoder is connected properly and that the configured port is the correct one. The installation of an USB-RS232-Converter cable is mostly done with plug and play utilities of the computer system. To check, which COM port the converter is using, you need to open the system settings and the item system. In this menu use the hardware tab and the device manager must be opened. Here you find the port number for your USB-RS232-Converter. This must be set in RCM Ultimate.

If you use the LAN-connection for the AMBr3 please note, that the IP-Addresses must be set properly. More information you will find in the user manual which comes with your decoder.

Use the Transponder Log file during preparing and running a heat: When a heat is prepared in the race state window (menu item timekeeping) the car and the drivers are registered and referenced to this heat. When no drivers are known then you have probably the wrong heat opened or the wrong drivers at the track. Such problems can be detected easily when you are observing the transponder log file. Club / Private - If the hand out transponders are active these transponders are remarked as Club. "Private" are personal transponders or not activated hand out transponders used as temporary transponders.

## 6.2.2 Systemmessages

The systemmessages log is used to register all inconvenient exceptions during the handling and usage of the program. These can be only warnings but also errors. In the case of a wrong behaviour of a function the recent log entries can help the RCM developers to solve the issue fast. In such a case, please send us a copy of the logfile.

But it can also be helpful for you. For example, if you have empty lists or no heats even if you think there should be something, please have a short look into the system messages. Simple remarks like "wrong rule" or "track not assigned" can be easily corrected.

The screenshot shows the 'Systemmessage Protocol' window. It contains a 'Filter' section with checkboxes for 'List Info Messages' and 'List Error Messages'. Below this is a 'List of Systemmessages' table with columns: #, Type, Source, Timestamp, and Systemmessage. The table lists 156 records, all of which are errors related to 'PilotKey not found' for various events and pilots. The bottom of the window shows '156 Datarecords' and a 'Close' button.

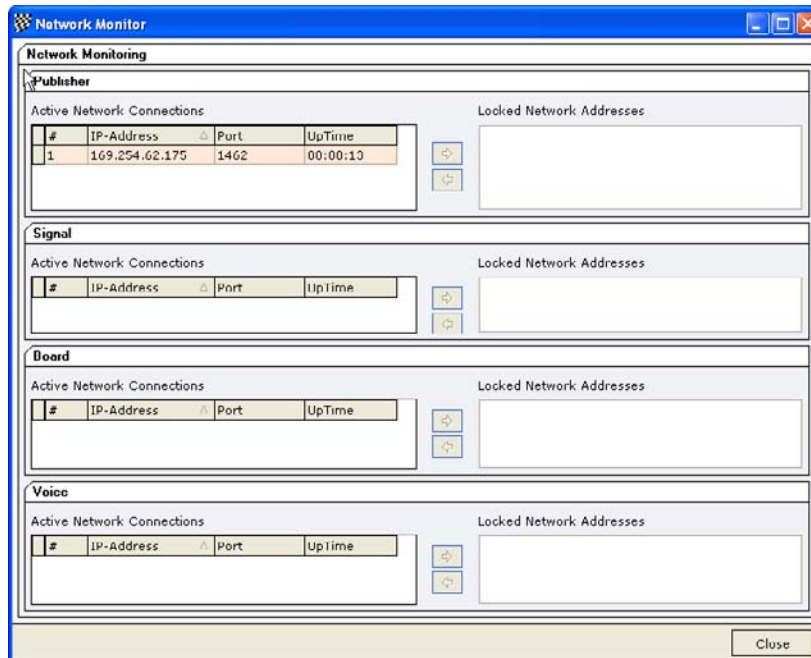

#	Type	Source	Timestamp	Systemmessage
156	Error	Exception	27.05.2008 15:32:30	Listenindex überschreitet das Maximum (-1) [Class: TPanel]
155	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 3 / Pilot: 57]
154	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 3 / Pilot: 56]
153	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 6]
152	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 5]
151	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 28]
150	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 27]
149	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 26]
148	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 25]
147	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 24]
146	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 22]
145	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 21]
144	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 20]
143	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 19]
142	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 18]
141	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 17]
140	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 16]
139	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 15]
138	Error	EventLoader	27.05.2008 15:25:09	PilotKey not found [Event: 3 / Section: 2 / Pilot: 14]

## 6.3 Monitoring

### 6.3.1 Network

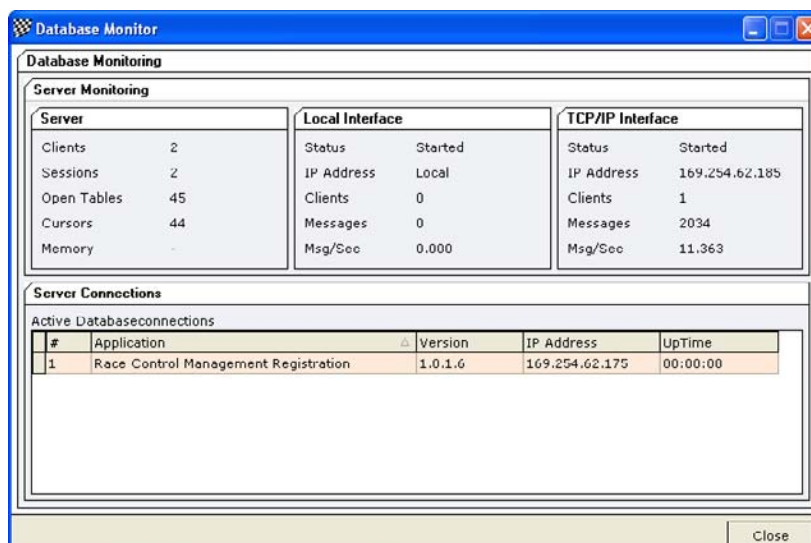

All RCM applications (clients) connected to RCM Ultimate are controlled by RCM Ultimate.

The network-addresses (IP addresses) in the left column of the window are active. You can lock single addresses. Just move the addresses to the right column of the window. If this address is locked, RCM Ultimate closes the connection with this client. A reconnection is only possible if the address is activated in RCM Ultimate (move it to the left column) and the client is restarted.

### 6.3.2 Database

Some RCM applications are not only connected to RCM Ultimate via network and IP address but have a direct access to the database used by RCM Ultimate respectively need both connections.

The following applications are listed in this window:

RCM Registration: This client is used for the registration of drivers. You can print badges for the drivers as well as the data sheets for the drivers. In between the race it is possible to print all available reports without interfering with the time keeping.

RCM Tech: This client is used for the technical inspection and register all results of the inspection. RCM Tech is supported by the homologation lists of the federations and should be kept up to date regarding the technical rules of the national or international federations. Entered measurements are compared with the rule and set to valid or invalid. The information of cars not corresponding with the rules are reported to RCM Ultimate. This software is not yet available at the moment.

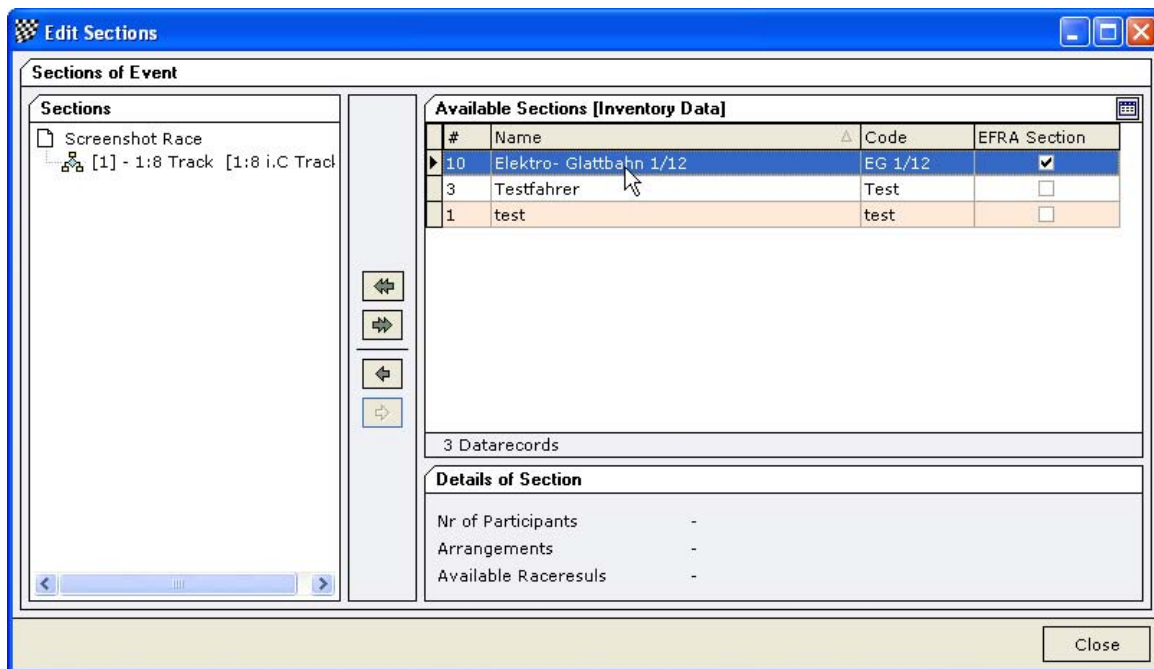

## 7 Listmanagement

The list management is used for selecting the participants and managing the sections. This menu is only active if an event is loaded.

### 7.1 Sections

For your event you have to select the sections which will be run first before you can add the drivers to the driver list. If you have to change the sections for your event, you can add or delete sections with this function of RCM Ultimate.

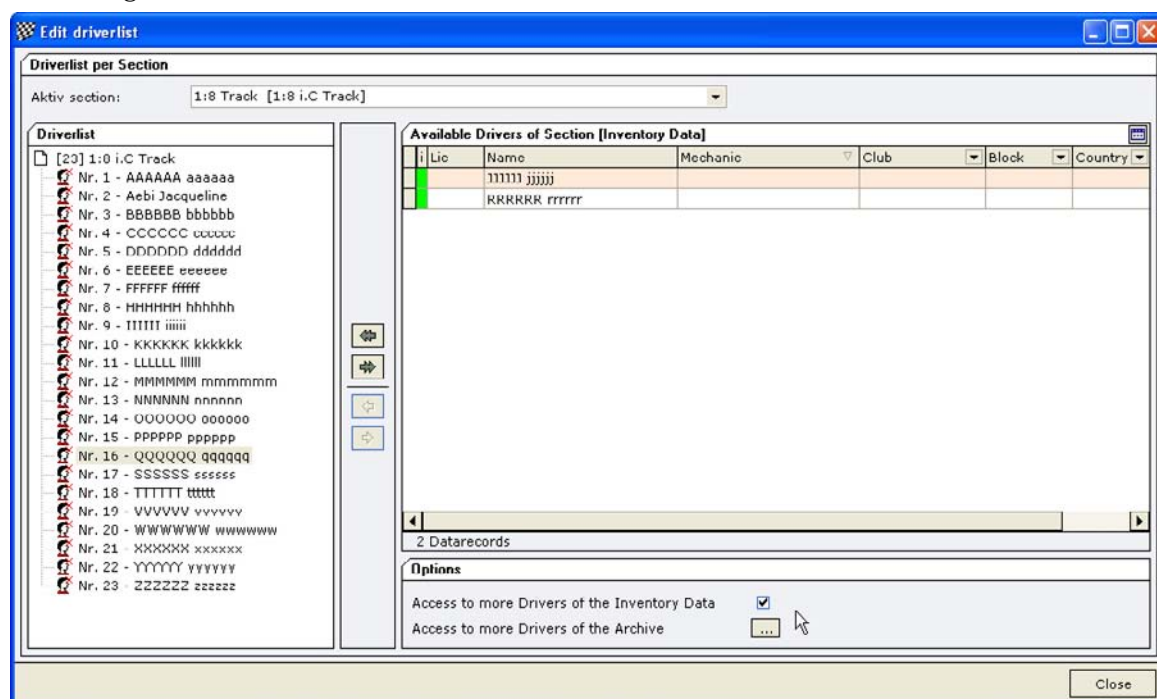

The handling in this window is identically to that window of the driver list. Having more than one track assigned to an organizer and adding a section to the event, you will be asked on which track the section will be run.

If you mark a section in the left column of the window you see the details (number of participants and the availability of arrangements and raceresults) on the bottom of the right column.

The order of the sections can be changed by drag&drop. Just click on the name of the section, hold the mouse key pressed and drag it to the desired position. You can order the sections as you run the sections in the race.

## 7.2 Drivers

Here you can select the drivers per section. The right column shows to you the drivers assigned to the specific section selected on top of the window. These are all marked green.

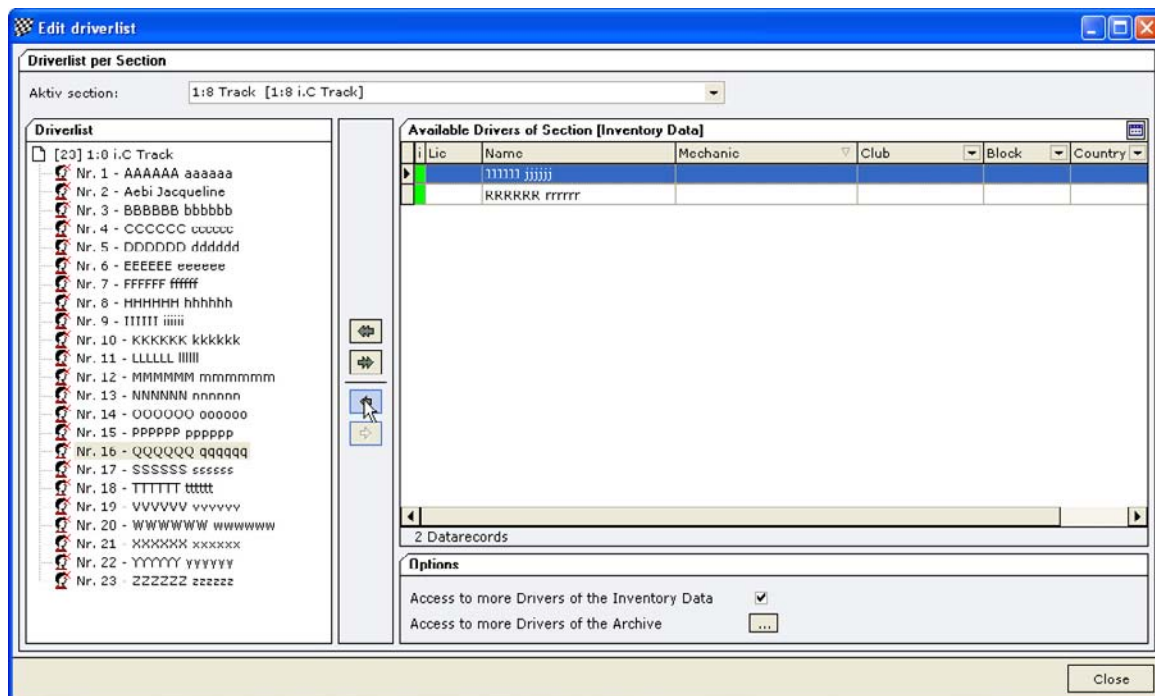

More drivers of the inventory data can be added by activating "Access to more drivers from the inventory data". These drivers are marked yellow.

In the left column of the window all the drivers are displayed, which have already added to the driver list for the loaded event and the selected section.

## 7.2.1 Add a driver to the driver list

Click left on the driver in the right column and use the arrow left button to add the driver to the driver list. The double arrow button left adds all drivers from the right column to the driver list.

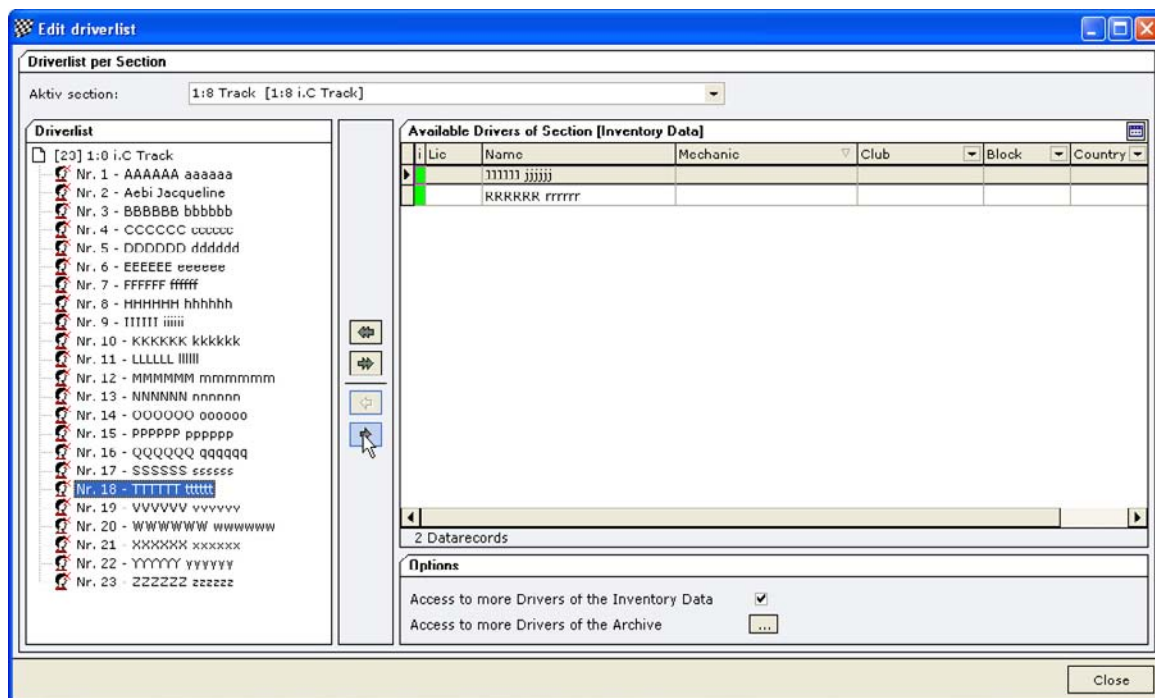

If you add a driver from the inventory data to the driver list which is not assigned to the selected section (Access to more drivers of the inventory data is activated and the driver is marked yellow in the list), this will be done automatically. But you have to add the entries for frequency and transponder for that specific driver. You can do this when you arrange the heats.

The list of drivers in the inventory data can be very large. The search and select functions as described in chapter 4 can help you to find the drivers you need.

## 7.2.2 Remove a driver from the driver list

You can only remove drivers from the driver list which are not already arranged in a heat. If you want to remove a driver, which is arranged in a heat, you have to remove him from the heats in arrangements of the heats first.

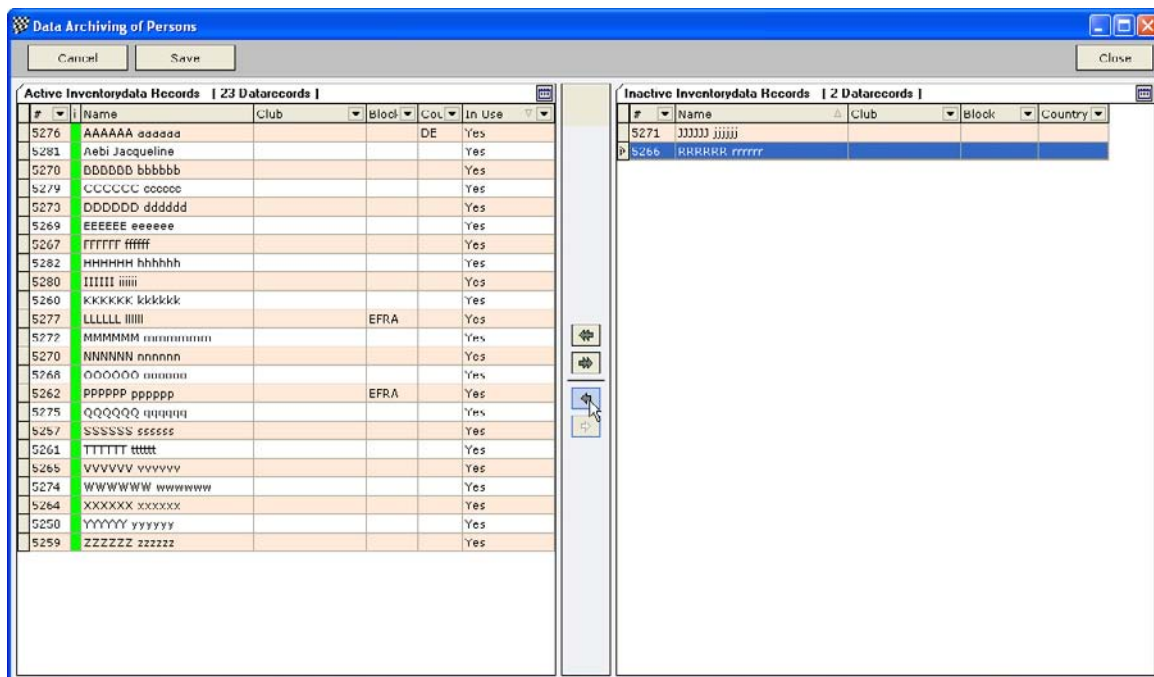

To remove a driver you just click the name in the left column and use the arrow right button. To remove all drivers not arranged in a heat, you can use the double arrow right button.

### 7.2.3 Adding drivers from the archive

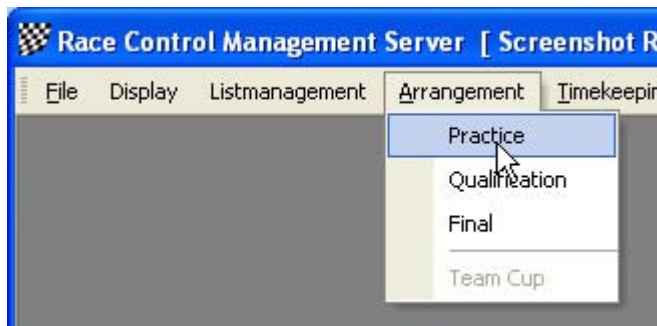

At the bottom of the window is a button with three dots just behind the text “Access to more drivers from the archive”. Left-clicking on this button opens a new windows which give you access to all drivers you have archived earlier (see Inventory Data/Data Archiving). You can now reactivate one or more of these drivers. Mark the driver in the right column and use the left-arrow-button in the middle of the window to reactivate the driver.

Please note that you have to save all changes before closing this windows. Otherwise all changes are lost.

## 8 Arrangement

This menu is only active with a loaded event. You can change the arrangement of the practice and qualification heats as well as of the finals. Even if the race has already started, you can make changes in the arrangements. Further on you can add or delete groups.

## 8.1 Practice

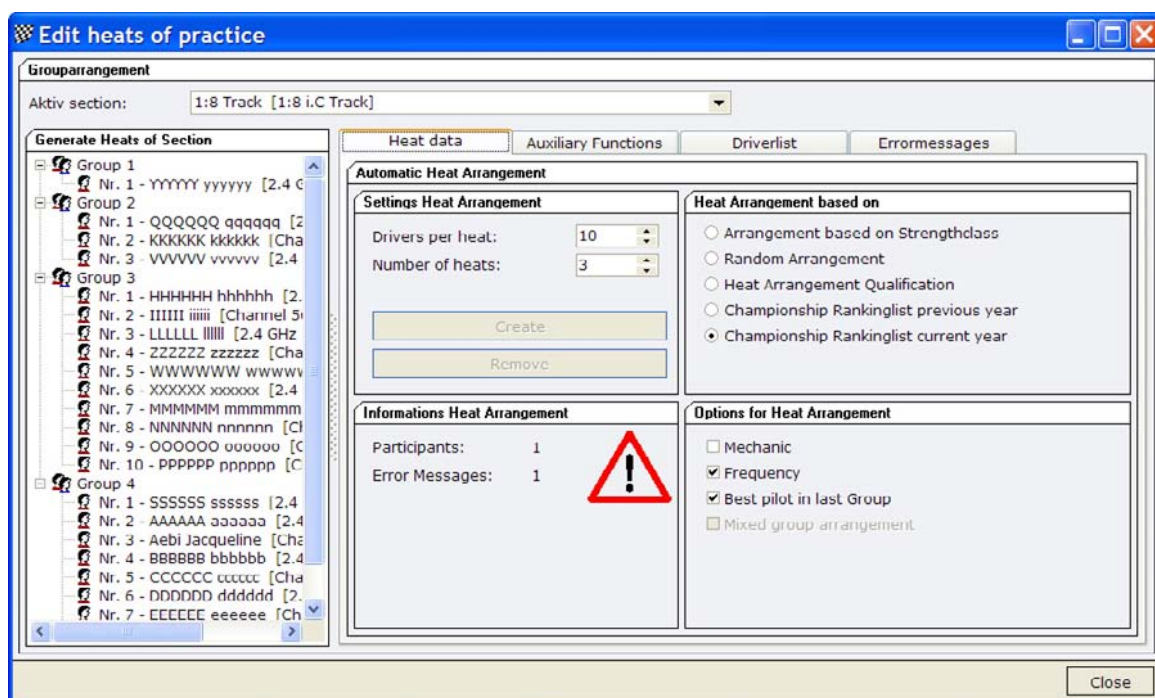

Here you can arrange all the heats for practice. It is only possible to do this, when an event is loaded and practice is activated in the definition of the rules for this section.

Using the heat data tab you can arrange the heats. With the driverlist tab you can modify the arrangement for single drivers. Having arranged the heats you see problems (for example frequency-problems) under the errormessages tab.

### 8.1.1 Arrangement of heats

With the Heat Data tab you can automatically arrange the practice heats or you can delete a existing arrangement. First of all you have to select the section on the top of the window.

With Settings Heat Arrangement you can define the numbers of drivers per heat and the numbers of the heats. Clicking on the create-button will automatically create the arrangement. With remove you can delete the arrangement (only possible, if no heats have already been run).

Heat Arrangement based on: Here you can define, if the arrangement is done according to a qualification list, the skill of the driver, a championship ranking or randomly.

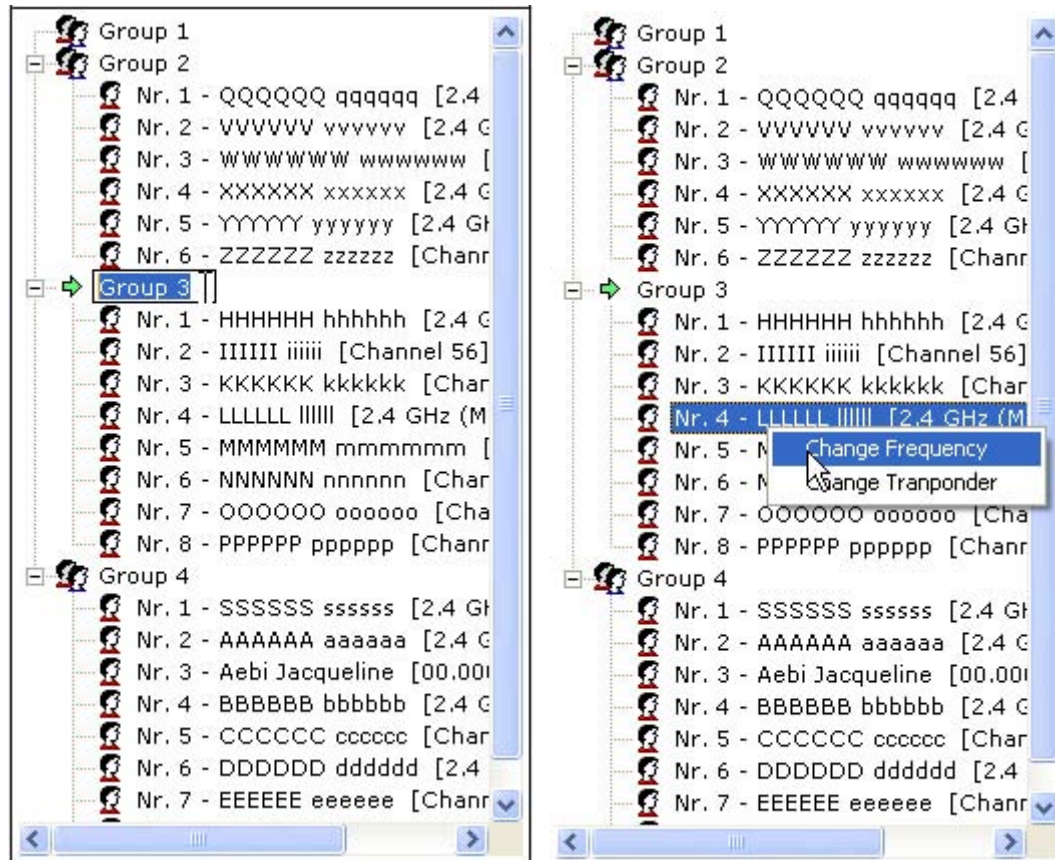

Options of the heat arrangement: If you activate "Mechanic", the arrangement takes into consideration that a driver who is acting as a mechanic for another driver (can be entered in persons of the inventory data) should not be in the same group.

Frequency should be activated always to avoid frequency clashes.

Usually the best drivers race in the last groups, so this feature should also be activated. Mixed group arrangement is only active if the rule is a Top Plus rule and should be activated in that case.

If you do not like the order of driver in the heats, you can move a driver simply with drag&drop. This means, you click left on the drivers name, keep pressing the left mouse button and drag the driver to the position you want. Then leave the left mouse button. You can move a driver even after qualification heats have been run.

The results of the driver will not be lost, even if you move him to another group. You can also move a complete group to another place by drag&drop. Just left click on the group, hold the mouse key pressed and move the group to the position.

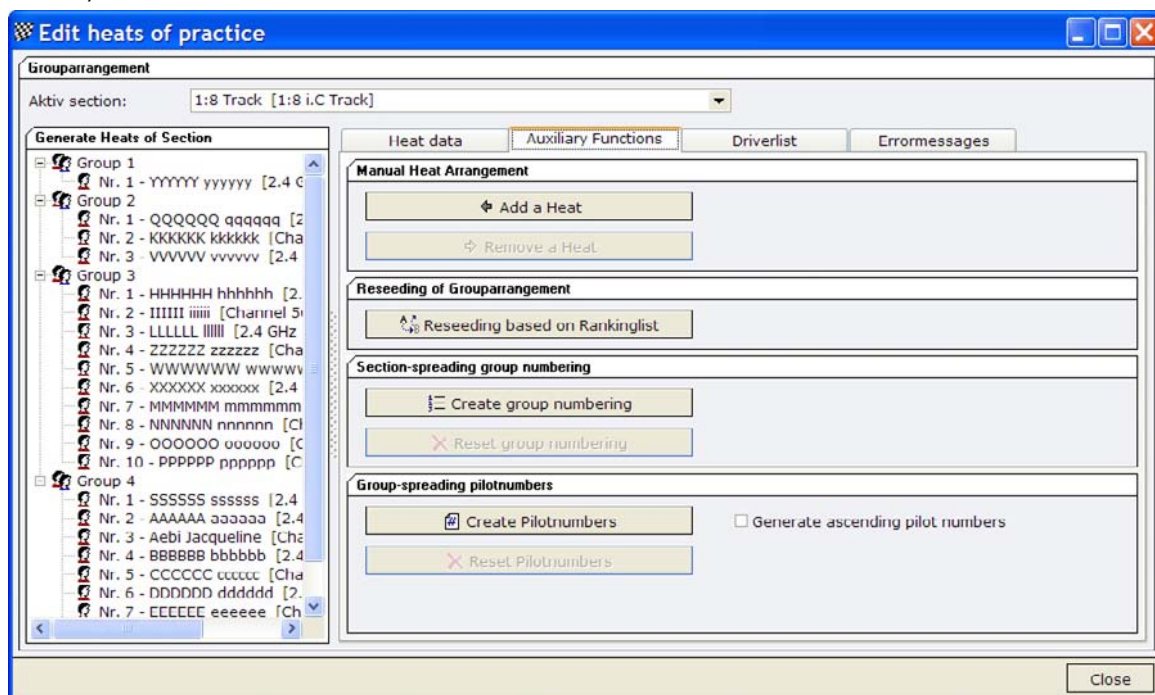

Further on you can rename a group. Right click on the group and after that click left on the group. Now you can edit the name. This is maybe useful when you run different sections and want your groups numbered serial.

If you have to change frequencies or transponder for a specific driver, you can do it here. If you click right on the drivers name a submenu allows you to change the frequencies or the transponder number.

## 8.1.2 Auxiliary Functions

Here you can do some additional tasks:

With “manual heat arrangement” you can add or delete a group. If you want to delete a group it must be marked in the left column “generate heats of section”. Deleting or removing a group is only possible as long as no qualification heat was finished.

With “Reseeding of Grouparrangement” you can reseed the heats according to the ranking list. This is only active if a rankinglist exists.

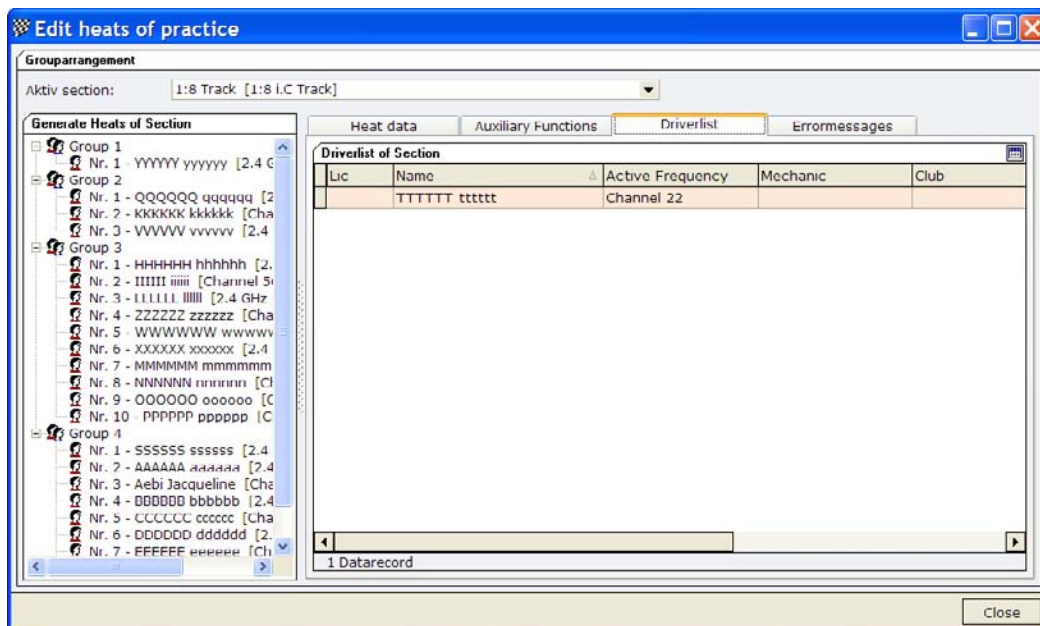

In “Section spreading group numbering” you can renumber the groups ongoing through all sections. And you can also reset this ongoing numbering-

Activating „Generating pilotnumbers” you can generate the pilotnumbers according to the heat groups. You can also reset these numbers. If you activate “Generate ascending pilots numbers” the pilotnumbers are generated continuous. This means, that the pilotnumbers are generated throughout the pilots without a number for the group.

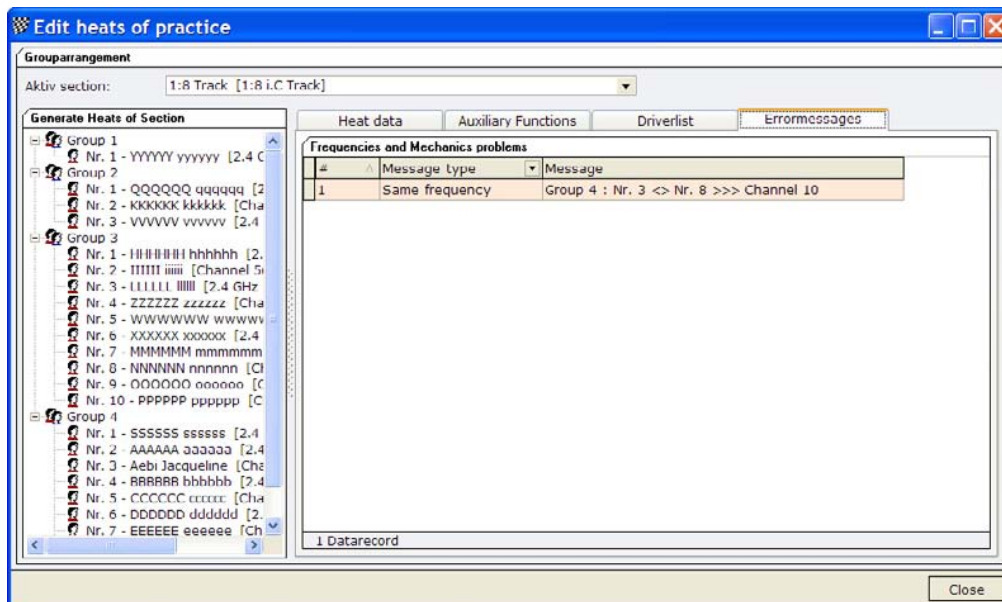

### 8.1.3 Driverlist

With this tab you can make changes for single drivers. You can remove a driver from a group and add him to another group. If you have created the arrangement of the heats automatically, the list in the right column of this window is empty (driverlist of section), otherwise the drivers not yet arranged in heats are displayed. If you want to remove a driver from a heat, you just click left on his name, hold the mouse button pressed and drag him from the left column to the right column of this window (driverlist of section). To move this driver to another group, drag&drop him from the driverlist of section to the appropriate group in the column generate heats of section.

### 8.1.4 Errormessages

Here you see all problems regarding the frequencies of the heats as well as other problems detected by RCM Ultimate. The same frequency of two drivers in one group will be displayed as well as all drivers with no frequency data in his inventory data record. You can change the frequency of a driver by clicking right on the drivers name.

## 8.2 Qualification

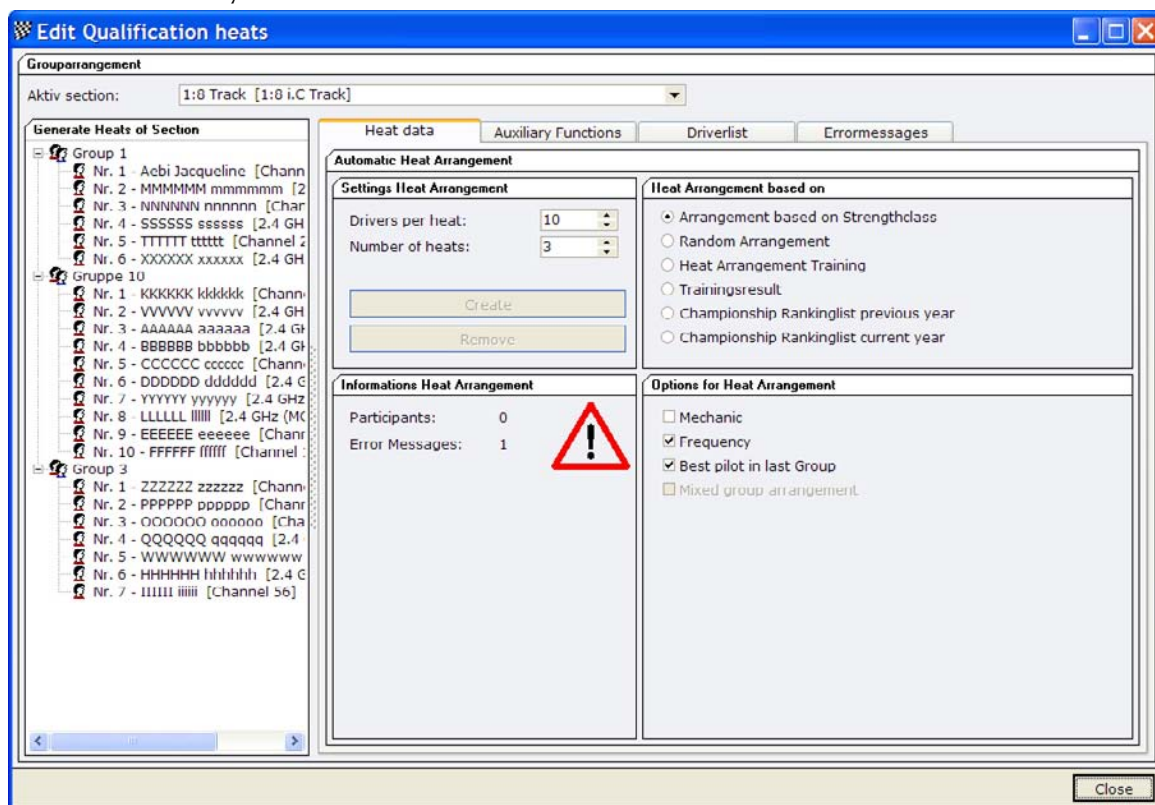

Here you can arrange all the heats for the qualification. It is only possible to do this, when an event is loaded and qualification is activated in the definition of the rules for this section.

Using the heat data tab you can arrange the heats. With the driverlist tab you can modify the arrangement for single drivers. Having arranged the heats you see problems (for example frequency-problems) under the errormessages tab.

### 8.2.1 Arrangement of heats

With the Heat Data tab you can automatically arrange the practice heats or you can delete a existing arrangement. First of all you have to select the section on the top of the window.

With Settings Heat Arrangement you can define the numbers of drivers per heat and the numbers of the heats. Clicking on the create-button will automatically create the arrangement. With remove you can delete the arrangement (only possible, if no heats has already been run).

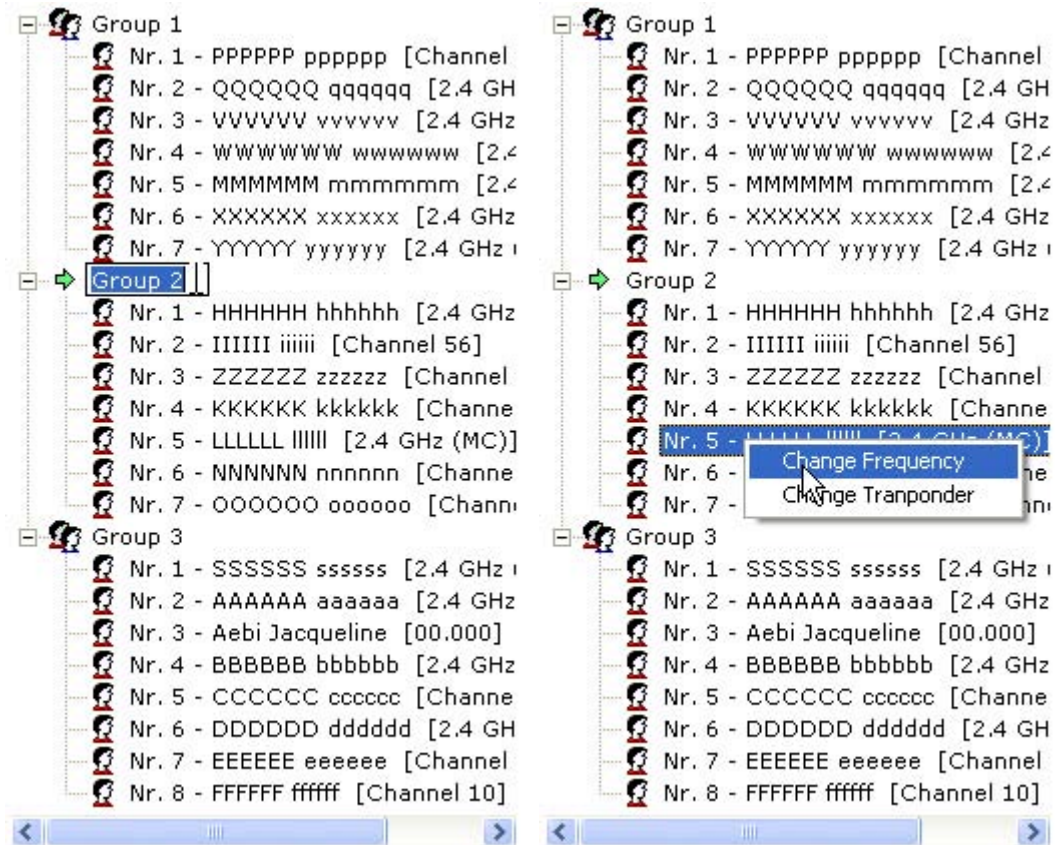

The heat arrangement can be influenced by several additional inputs:  
Heat Arrangement based on: Here you can define, if the arrangement is done according to the arrangement in practice, the result of the practice, the skill of the driver, a championship ranking or randomly.

Options of the heat arrangement: If you activate "Mechanic", the arrangement takes into consideration that a driver who is acting as a mechanic for another driver (can be entered in persons of the inventory data) should not be in the same group.

Frequency should be activated always to avoid frequency clashes.

Usually the best drivers race in the last groups, so this feature should also be activated. Mixed group arrangement is only active if the rule is a Top Plus rule and should be activated in that case.

If you do not like the order of driver in the heats, you can move a driver simply with drag&drop. This means, you click left on the drivers name, keep pressing the left mouse button and drag the driver to the position you want. Then leave the left mouse button. You can move a driver even after qualification heats have been run. The results of the driver will not be lost, even if you move him to another group. You can also move a complete group to another place by drag&drop. Just left click on the group, hold the mouse key pressed and move the group to the position.

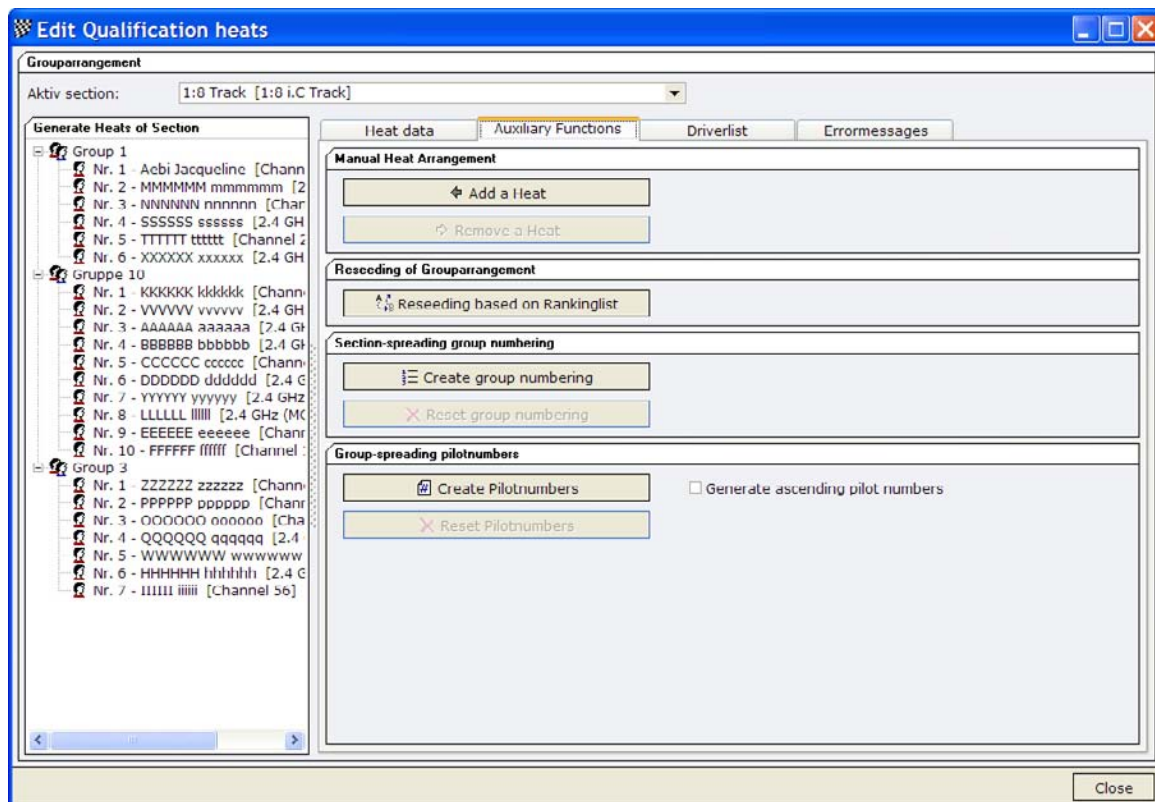

Further on you can rename a group. Right click on the group and after that click left on the group. Now you can edit the name. This is maybe useful when you run different sections and want your groups numbered serial.

If you have to change frequencies or transponder for a specific driver, you can do it here. If you click right on the drivers name a submenu allows you to change the frequencies or the transponder.

## 8.2.2 Auxiliary Functions

Here you can do some additional tasks:

With “manual heat arrangement” you can add or delete a group. If you want to delete a group it must be marked in the left column “generate heats of section”. Deleting or removing a group is only possible as long as no qualification heat was finished.

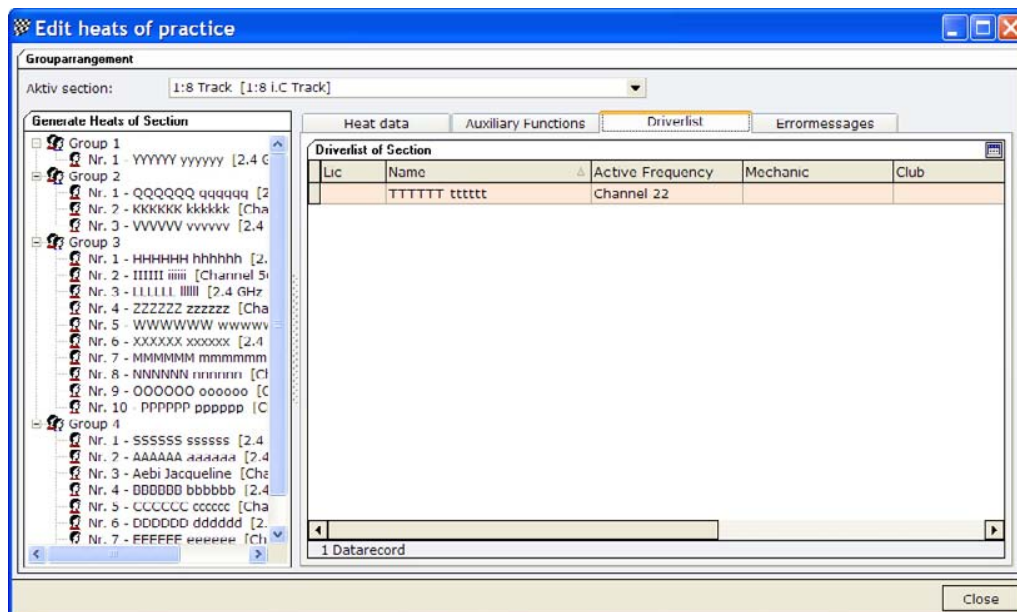

With “Reseeding of Grouparrangement” you can reseed the heats according to the ranking list. This is only active if a rankinglist exists.

In “Section spreading group numbering” you can renumber the groups ongoing through all sections. And you can also reset this ongoing numbering-

Activating „Generating pilotnumbers“ you can generate the pilotnumbers according to the heat groups. You can also reset these numbers. If you activate “Generate ascending pilots numbers” the pilotnumbers are generated continuous. This means, that the pilotnumbers are generated throughout the pilots without a number for the group.

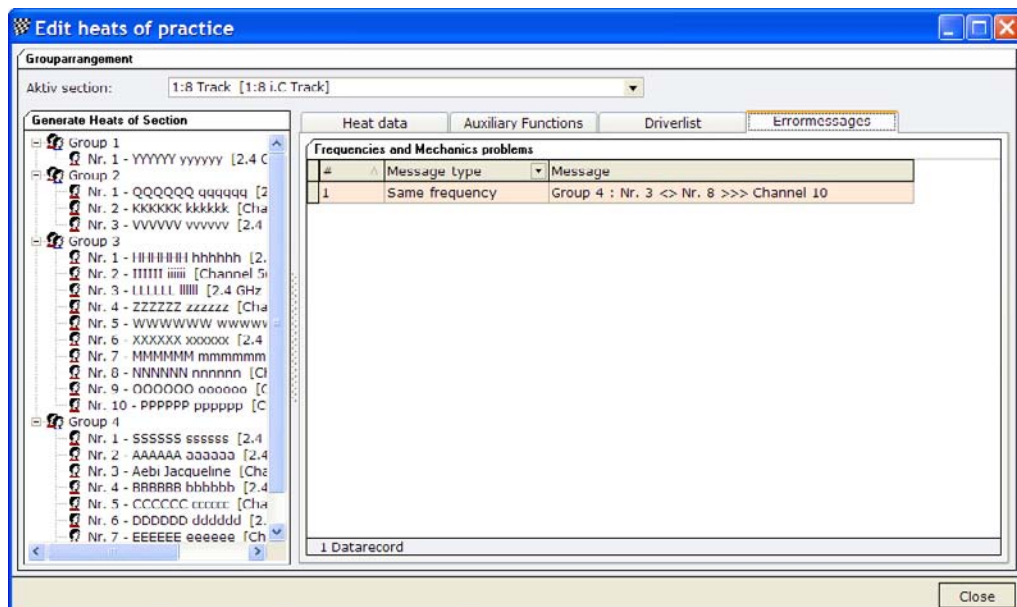

### 8.2.3 Driverlist

With this tab you can make changes for single drivers. You can remove a driver from a group and add him to another group. If you have created the arrangement of the heats automatically, the list in the right column of this window is empty (driverlist of section), otherwise the drivers not yet arranged in heats are displayed. If you want to remove a driver from a heat, you just click left on his name, hold the mouse button pressed and drag him from the left column to the right column of this window (driverlist of section). To move this driver to another group, drag&drop him from the driverlist of section to the appropriate group in the column generate heats of section.

### 8.2.4 Errormessages

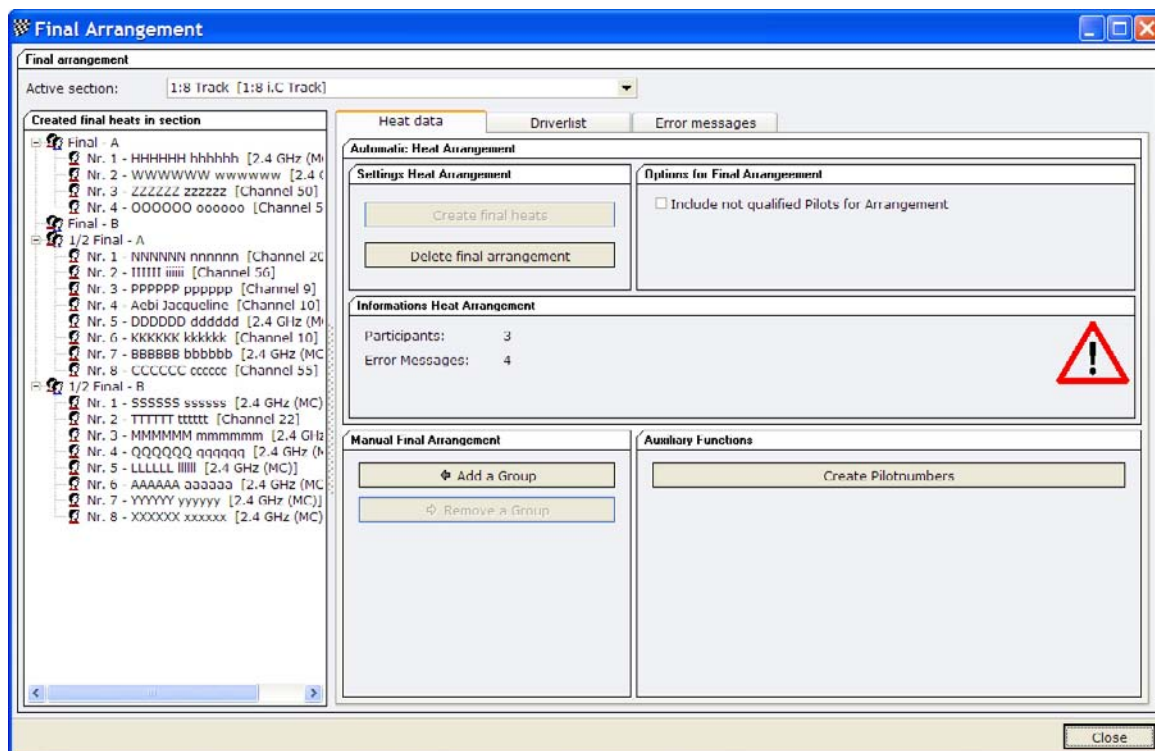

Here you see all problems regarding the frequencies of the heats as well as other problems detected by RCM Ultimate. The same frequency of two drivers in one group will be displayed as well as all drivers with no frequency data in his inventory data record. You can change the frequency of a driver by clicking right on the drivers name.

## 8.3 Final

This menu is only active if a event is loaded. Before creating the finals you can see under the driver tab a list of all drivers having a valid qualification for the finals (depending on the rule for the selected section). Before you arrange the finals, you can specify whether not qualified pilots should be included in the arrangement or not.

Under the heat data tab you can now click on the button create final heats and the arrangement of all finals will be automatically done according to the rule of the selected section and the result of the qualification. With the error messages tab you see frequency problems. These can be solved as described in the arrangement of the qualification heats.

In the lower part of the window (manual heat arrangement) you can add or delete a final. If you want to delete a final it must be marked in the left column "generated finals of section". Deleting or removing a final is only possible as long as no final heat was finished.

You can change the order of the drivers in the finals by simply drag&drop one or another driver to another position. But, please note, that the program may be not calculate these drivers correctly, when these drivers will moved up from a lower to the higher final. You have to correct this manual.

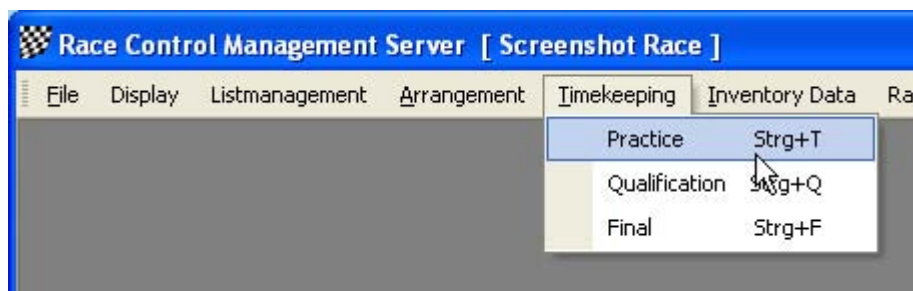

The printing of the arrangement of the finals will be done through the overview/print menu.

Remark: All corrections in the qualification heats affecting the ranking list should be finished before arranging the finals. If you already have arranged the finals and are forced to make a correction in the qualification heats please delete the arrangement of the finals and create new final heats.

## 9 Timekeeping

This menu is only active if an event is loaded. Here you start the practice heats, the qualification heats and the finals. After a race is finished you can print the results (for printing all other reports please refer to the menu display).

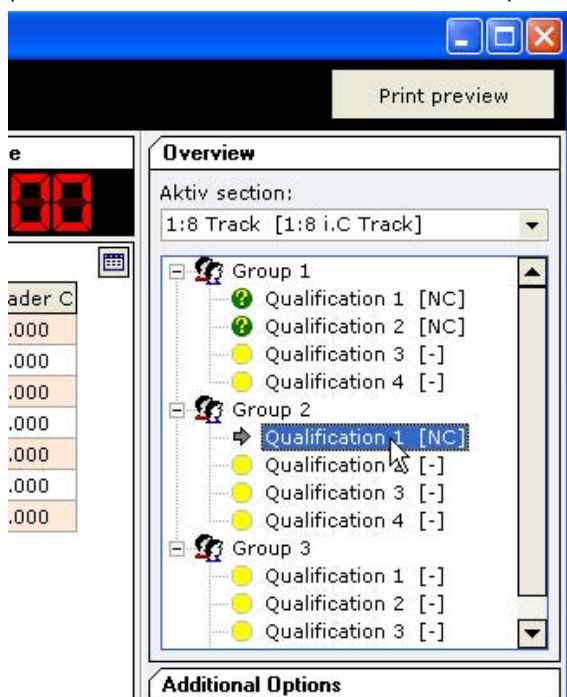

After the heat you can correct the results. Some penalties can be given in between the race. All changes made when the heat is running can be cancelled after the race.

The sequence of racing and the scoring of the races are determined by the rule. The race overview is the same for practice and qualification heats as well as finals. The following explanations refer to the time keeping in general.

### 9.1 Prepare a heat

Please select first in the right column the section and the heat of the final you want to run. The drivers of that heat/final will be displayed left. If there are frequency conflicts in a selected heat, you will see an corresponding error message. You can edit the transponder and frequencies of a driver here. Just click right on the drivers name and select transponder or frequency from the submenu. Please check in the right column the race settings. If necessary you can correct now these settings. The start mode, the valuation, the locktime and the racetime can be changed. Further on you can set the track condition to dry or wet.

Clicking on the button just below the display difference to the time schedule you can activate additional columns for the race overview. Especially for the speaker the column “delay to the first car” is quite interesting.

The screenshot shows the RCM Ultimate software interface. At the top, there are buttons for 'Interrupt test', 'Abort Race', 'Clear Race', 'Finalize Race', 'Continue', and 'Print preview'. Below these are four large digital displays: 'Race time' (00:05:00), 'Current Race time' (00:00:00), 'Remaining Race time' (00:05:00), and 'Difference to Timeschedule' (00:00:00). The main area is divided into several sections:

- Race overview:** A table with columns: # Nr, Car, Driver, I, T, Lap, Laptime. It lists 7 cars with their respective data.
- Field selection for race state:** A dialog box with checkboxes for:
  - ☒ Field Transponder
  - ☐ Field Club
  - ☐ Field Country
  - ☐ Field Team
  - ☐ Field P-Number
  - ☐ Field Speed
  - ☒ Field Delay to first vehicle
  - ☐ Field Delay to previous vehicle
- Overview:** A tree view showing the race structure, including groups and qualifications.
- Additional Options:** A section for 'Teamcup Lapoverview'.
- Racesettings:** A section for 'Racemode' (Singlestart), 'Valuation' (Laptime), 'Offtime' (10), and 'Racetime' (00:05:00).
- Track Condition:** A section for 'dry' or 'wet'.
- Status Report engine:** A section for 'Reports are up to date'.

At the bottom, there are four small tables: 'Track Heatrecord', 'Track Laprecord', 'Actual Dayrecord', and 'Actual Laprecord'.

## 9.2 Warm-up time and transponder check

Normally the drivers drive some laps on the track before you start the heat. Use this time to check the proper working of all transmitters and to check whether all drivers are on the track or not. If a transponder passes the loop, the corresponding driver will be marked yellow. This means, that his transponder number is correctly registered.

You can also open the transponder log file with the F4 key. Here you can see if all of the transponders are assigned to a driver. If a car passes the loop and you see no name in the transponder log file but a transponder number (in the race overview you see this transponder on the last row red marked) you have to find out, which driver is using this transponder. Double clicking on the transponder (in the race overview) will open a new window displaying all drivers which have not already passed the loop with a registered transponder.

The screenshot shows the RCM software interface. The main window is titled "Runs [ Group 2 - Run 2 ]". It has several tabs: "Interrupt heat", "Abort Race", "Start Race", "Finalize Race", "Countdown", and "Print preview". The "Start Race" tab is active. The interface displays various timing information: "Race time" (00:05:00), "Current Race time" (00:00:00), "Remaining Race time" (00:05:00), and "Difference to Timeschedule" (00:00:00). Below this is the "Race overview" table, which lists drivers and their transponder numbers. A dialog box titled "Transponder Assignment [P Nr: 9 / TX: 1234564]" is open, showing a table with columns for "Car", "Driver", and "Transponder". The table lists drivers and their assigned transponder numbers. The "Transponder" column has four sub-columns: "Transponder 1", "Transponder 2", "Transponder 3", and "Transponder 4". The "Transponder 1" column is currently selected, and the value "1234564" is entered in the first row.

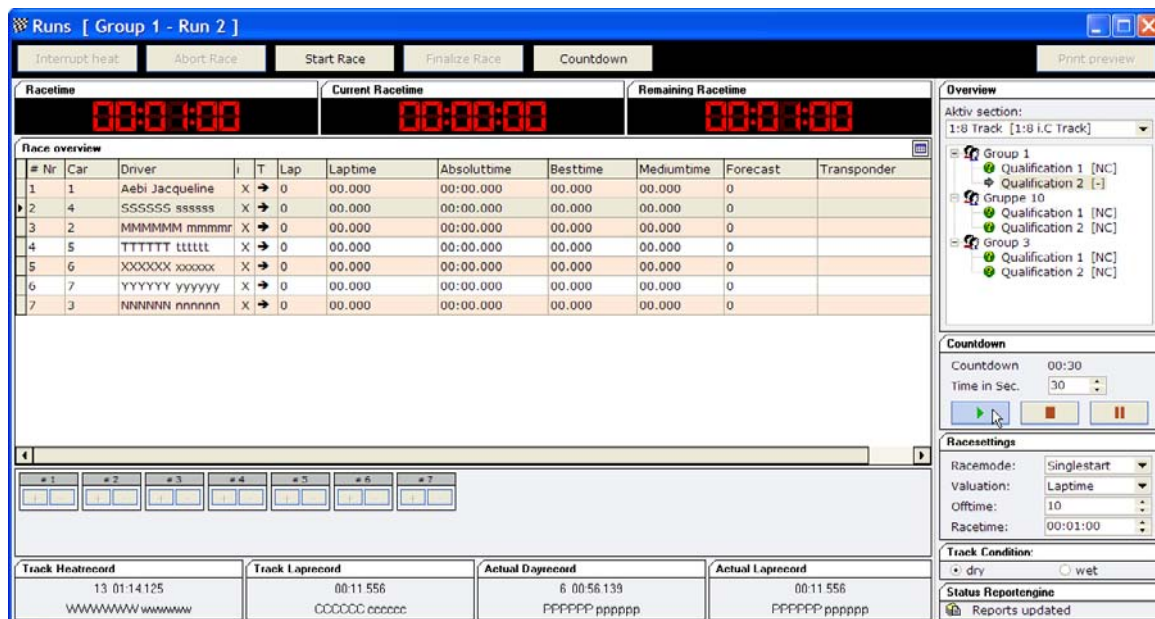

Car	Driver	Transponder 1	Transponder 2	Transponder 3	Transponder 4
1	HHHHHH hhhhhh	0	0	0	0
2	IIIIII iiiiii	0	0	0	0
4	KKKKKK kkkkkk	0	0	0	0
5	LLLLLL llllll	0	0	0	0
6	NNNNNN nnnnnn	0	0	0	0
7	OOOOOO oooooo	0	0	0	0

If you know the driver, you can easily assign this transponder to this driver. Just double click on the drivers name. You can do it even after the race has been started. This means you can start the race and assign this transponder to a driver between the race time. The laps and the times will be assigned to the driver and will not be lost. If it is a personal transponder it will be registered in the first empty field of the transponder settings of the driver. If no field is empty, the first will be overwritten. If the transponder is one of the hand out transponder it will be assigned to the field temporary transponder.

If a driver uses a timeout in a final or subfinal, click right on the drivers name and select timeout from the submenu. A big clock counting the time down appears. The time for a timeout is set in Configuration - Time Keeping - General. A timeout is printed on the result sheet.

### 9.3 Countdown

Directly from, RCM Ultimate or with the optional program RCM Voice you can automate the starting procedure. Clicking on the countdown button will open another window, where you can adjust the preparation time. The countdown is started by clicking the green arrow button in this window. By clicking on the other buttons, you can cancel the countdown (red square button) or you can interrupt it (two red lines). Via a sound card in your computer the remaining preparation time will be announced in certain time intervals. Further on the race will be started after the preparation time. The announcements can be defined under racemanagement/messages/announcements of in RCM Ultimate or RCM Voice. You can close this window by clicking again on the countdown button.

### 9.4 Start the heat

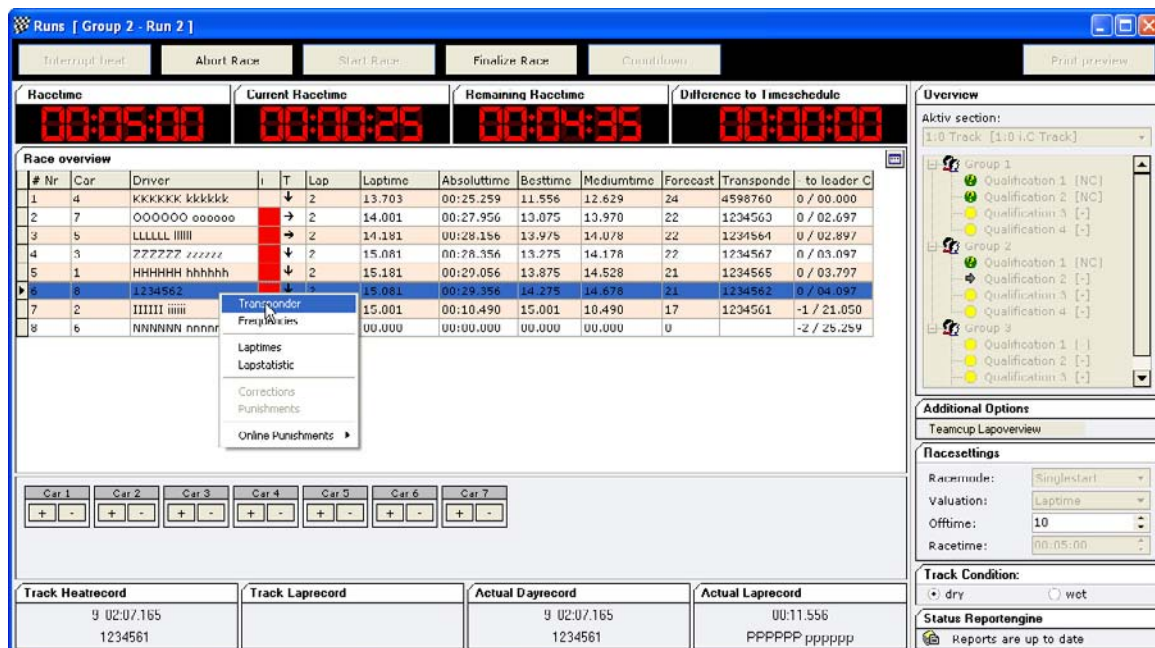

You start the heat or the final by clicking on the start race button or by pressing the function key F5 (if you do not use the countdown feature). According to the selected rule a delayed start or a groupstart will be executed. A small red marking in a drivers row shows the blocking time. No laps will be counted within this time, but the passing will be registered in the background. This prevents illegitimate corner cutting.

If now a transponder number is displayed in the race overview, this transponder can be assigned to a driver as described above. A double click on the transponder number opens a windows showing all drivers to which this transponder can be assigned. The laps and times counted for this transponder will be assigned to the driver and will not be lost.

You can make corrections to the transponder numbers and frequencies for each driver by clicking right on the drivers name. In the submenu select what you want to change. But here you have to type in the information.

The screenshot shows the RCM software interface with the 'Race overview' table. A right-click context menu is open over driver 6, showing options: Transponder, Frequencies, Laptimes, Lapstatistic, Corrections, Punishments, and Online Punishments.

#	Nr	Car	Driver	i	T	Lap	Laptime	Absoluttime	Besttime	Mediumtime	Forecast	Transponde	- to leader C
1	4	KKKKKK	kkkkkk			2	13.703	00:25.259	11.556	12.629	24	4598760	0 / 00.000
2	7	OOOOOO	oooooo			2	14.001	00:27.956	13.075	13.970	22	1234563	0 / 02.697
3	5	LLLLLL	llllll			2	14.181	00:28.156	13.975	14.078	22	1234564	0 / 02.897

5	1	HHHHHH	hhhhhh			2	15.181	00:29.056	13.875	14.528	21	1234565	0 / 03.797
6	8	1234562				2	15.081	00:29.356	14.275	14.678	21	1234562	0 / 04.097
7	2	IIIIII	iiiiii			2	15.001	00:10.490	15.001	10.490	17	1234561	-1 / 21.050
8	6	NNNNNN	nnnnnn			2	00.000	00:00.000	00.000	00.000	0		-2 / 25.259

If a Teamcup is activated under Settings/timekeeping you see in the right column below Additional Options the Teamcup Lapoverview. Clicking on that text opens a windows displaying the teamcup results.

The screenshot shows the RCM software interface with the 'Race overview' table. A 'Teamcup Lapoverview' window is open, displaying the 'Teamresult Overview' table.

#	Nr	Car	Driver	i	T	Lap	Laptime	Absoluttime	Besttime	Mediumtime	Forecast	Transponde	- to leader C

## 9.5 Control instruments during the active heat

### 9.5.1 Race time

On top of the race overview the race time, the current racetime and the remaining racetime is displayed. If you have activated to show the time difference to the timeschedule in Settings/Timekeeping/Timeschedule the difference to the time schedule will also displayed.

Current Racetime	Remaining Racetime	D
00:01:53	00:03:07	

	i	T	Lap	Laptime	Absoluttime	Besttime	Mediumtime	Fore
7		↑	6	13.887	01:24.914	13.275	14.139	22

### 9.5.2 Lap times

Click right on a driver name and select from the submenu laptimes. All lap times of this drivers will be displayed in a new window and can easily be checked. Further on you can open a lap statistic for each driver. This statistic shows the laptimes in a graphic format and can also be printed.

Progress In this column a bar is displayed. The length of the bar corresponds to the lap just raced by the driver. This shows to the timekeeper, when a driver should pass the starting line again.

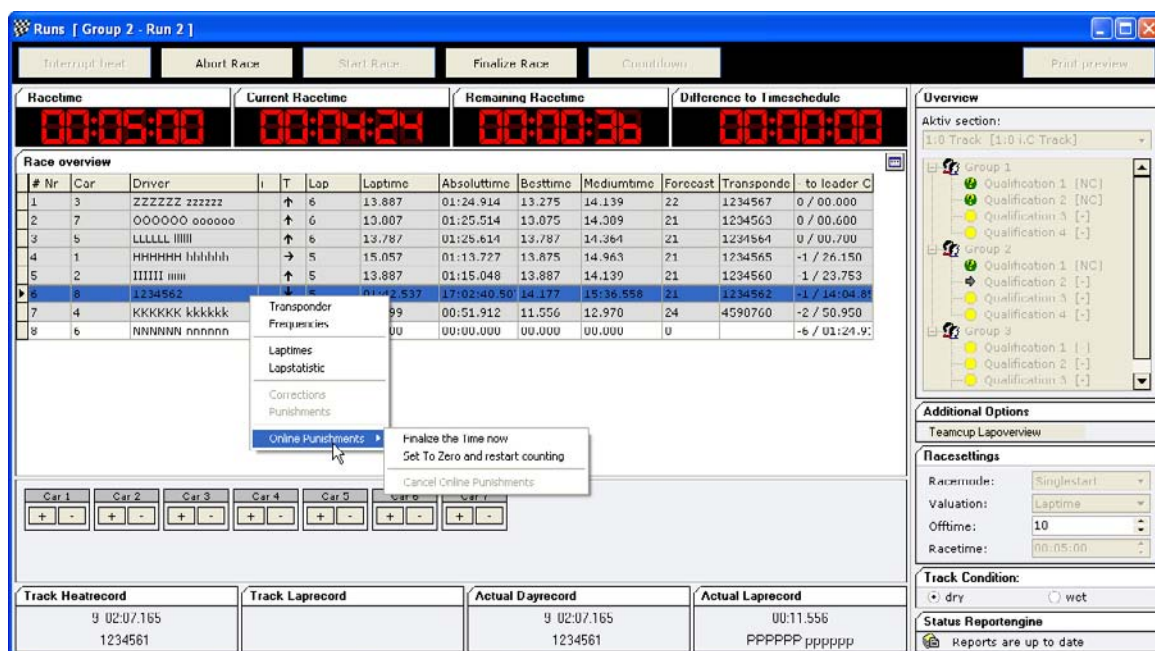

The screenshot shows the RCM software interface during a race. The top bar includes buttons for 'Interrupt test', 'Abort Race', 'Start Race', 'Finalize Race', 'Cooldown', and 'Print preview'. Below this, four digital displays show 'Racetime: 00:05:00', 'Current Racetime: 00:03:23', 'Remaining Racetime: 00:01:37', and 'Difference to Timeschedule: 00:00:00'. The 'Race overview' table lists drivers with columns for #, Nr, Car, Driver, i, T, Lap, and Laptime. A context menu is open over driver 4, showing options: 'Transponder', 'Frequencies', 'Laptimes', 'Lapstatistic', 'Corres. Lines', 'Punishments', and 'Online Punishments'. The 'Laptimes' window is open, displaying a table of lap data for driver 4, including Key, LapNr, BestTime, Absolut, Laptime, Transponder, and Track Condition. The bottom of the interface shows 'Track Heatrecord' and 'Track Laprecord' sections, along with a 'Print' button and 'Auto Update' checkbox.

### 9.5.3 Online corrections

During the time keeping of a heat, the correction menu is not available. You can only count manual laps for specific drivers. In the window below the race overview you find a counting box for each driver. The number identifying the counting box is the pilotnumber when available. If the pilotnumber is not set, the car number will be displayed. You can add laps (by clicking on the + sign) or reduce laps (by clicking on the - sign).

This interactions will be logged and registered as corrections. We can not recommend to count a driver manual for the whole heat. It should be good enough to inform the driver, that he has no transmitter in his car and that he should correct this situation. Manual counted laps will be marked on the result sheet. From the submenu which can be accessed through right clicking on the drivers name, you can access online punishments.

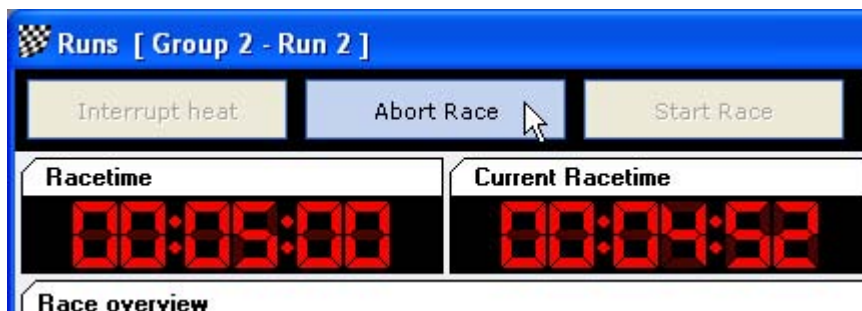

Set to zero and restart counting: Set the laps of a driver to zero and starts again to count.

Finalize the time now: The race will be finished for this driver and no more laps will be counted. The laps already counted will be kept.

Track condition: You can set the track condition to dry or wet when the race is running. The lap times will be marked with wet or dry. You can set the track condition after the race too. Right click on the heat in the Overview and select from the menu Dry- or Wet-Rating.

## 9.6 Abort a race

If you have to abort a race due to essential reasons, you can do it by clicking on the abort race button. The race will be aborted if you confirm it once again. All results will be set to 0.

## 9.7 Finalize race

After the race time is finished, the last lap of all drivers will be counted and the drivers, who have finished the race will be marked blue in the race overview. After the race time is finished, the last lap of all drivers will be counted and the drivers, who have finished the race will be marked blue in the race overview. In the lower part of the window, the numbers of the finished cars are listed. After all drivers have finished their race, you click on the finalize race button or you press the function key F6. The race will also be finished after the follow-up time.

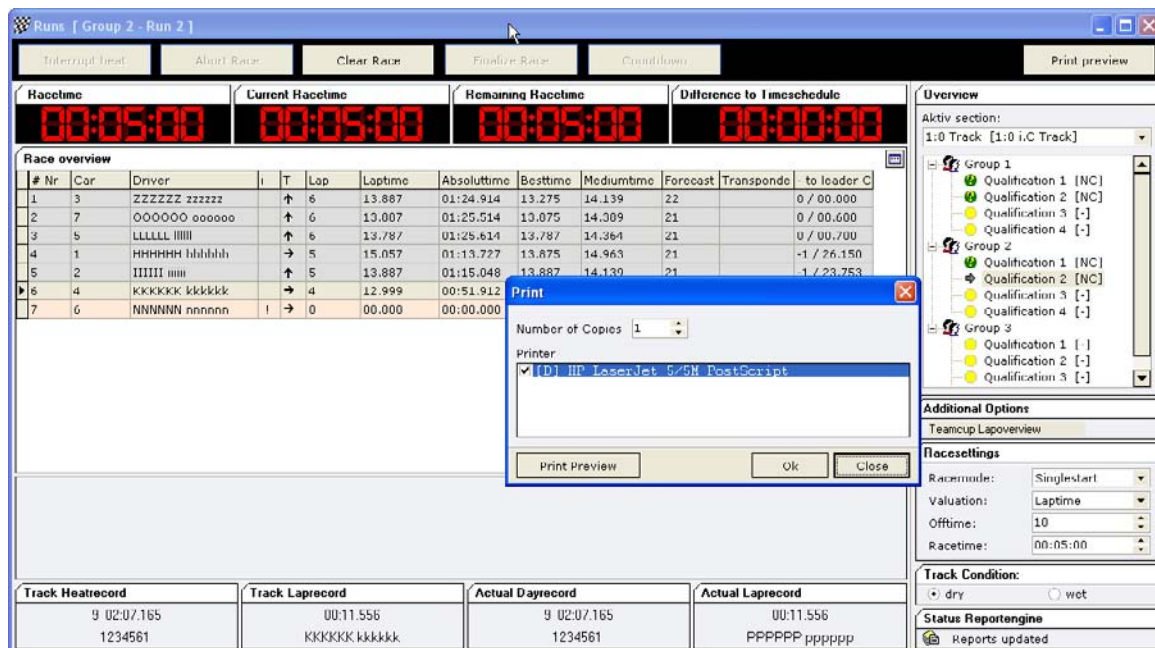

First you have to confirm new records (if there are some in that heat). New records will be saved in the inventory data affiliated to the race track and are printed on the result sheet. RCM Ultimate handles four different types of records: actual best lap, actual best result, best lap ever on this track, best result ever on this track.

The results are saved and according to the settings a database backup will be performed. Now all the reports necessary are generated. This process can take some seconds and the progress is displayed in a small window. The print menu will be displayed and after printing you are ready for the next heat.

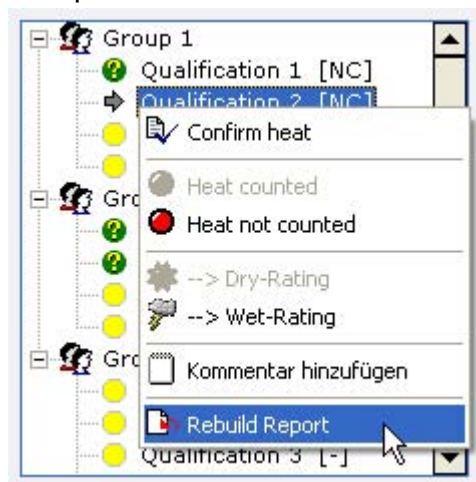

### 9.7.1 Print results

When a heat is finished, the printing menu will be displayed, You can select the printers and the number of copies to be printed.

Further more you can select whether to print directly or to preview the results. If you need another copy of the result, you can print it using the print preview button on the top right edge of the overview window.

If a transponder number is printed instead of a driver name, please mark this heat in the right column overview, click right on the heat and select rebuilt report. The transponder number will now be deleted.

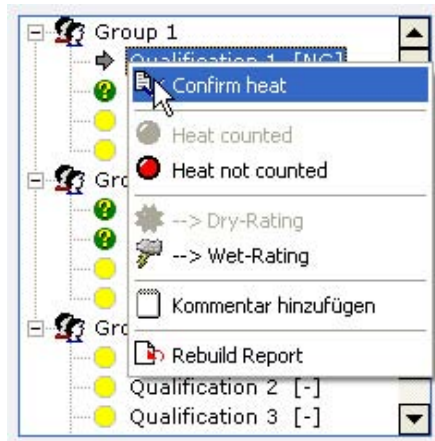

The result sheet can also be printed in the Display/Overview print menu (F2).

### 9.7.2 Confirmed - not confirmed

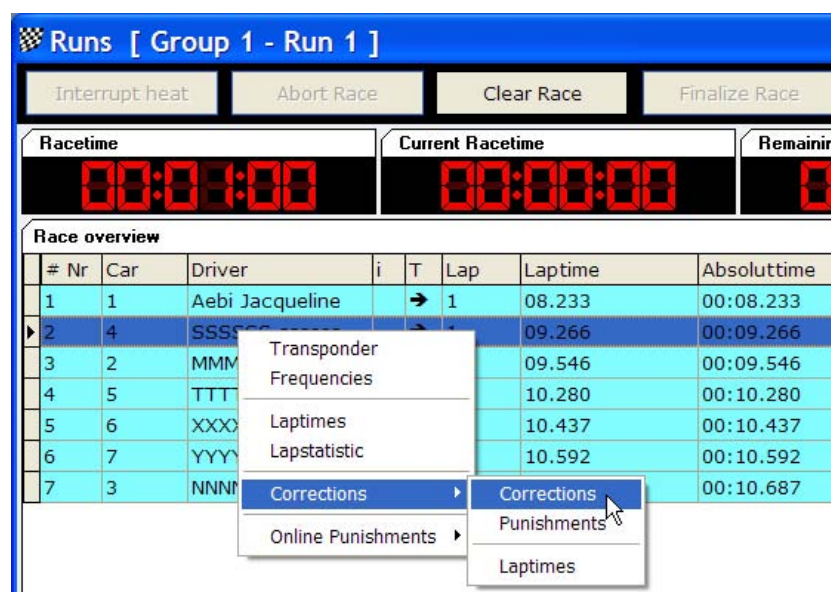

This is used for technical inspection. During qualification it is not necessary to confirm a heat. But during finals this feature will be used for the move up of drivers to the next higher final. Only if a final is confirmed, the drivers can move up. If you have to made corrections to the result of a final, you have to reconfirm this final. You confirm a heat/final by right clicking on the heat/final in the overview section. From the menu select confirm. When confirming a subfinal the move up of drivers will be done automatically by RCM Ultimate. If there are frequency conflicts in the higher subfinal due to the move up of drivers you see an error message with the frequency conflict.

Heat not counted: In the same menu you find the option, that this heat will not be counted. The result remains and can be printed, but the result is not used for the ranking list or the overall result. If necessary you can cancel this setting by selecting Heat Counted from the menu.

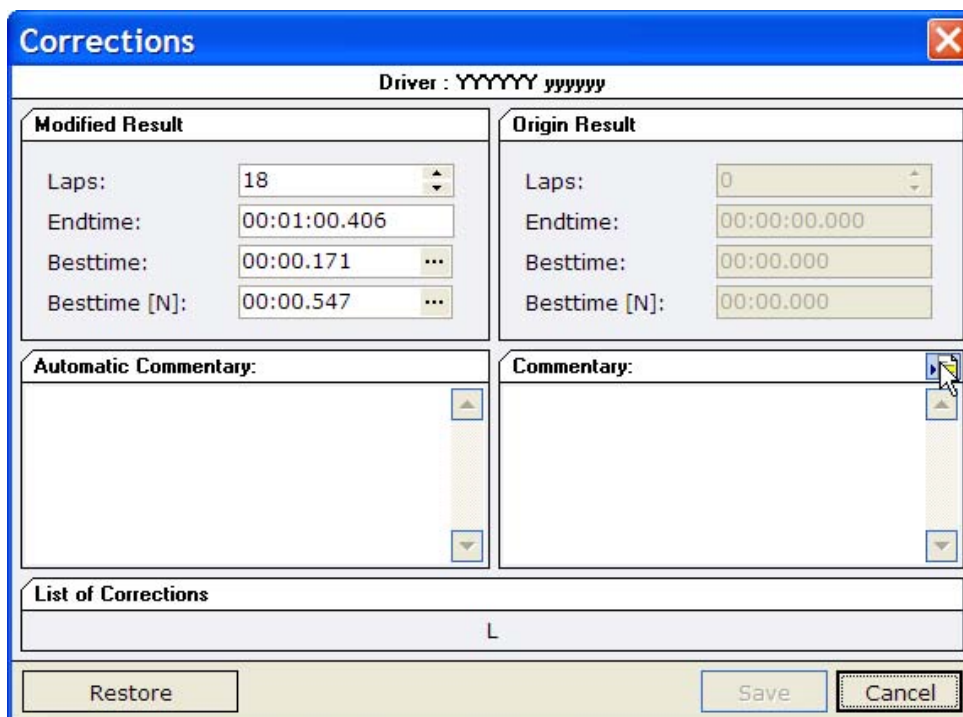

## 9.8 Corrections

In the race overview and after the race is finished you right click on a driver and choose corrections from the submenu.

A Jury comment will be added automatically. You can make changes on the heat results of the laps and of the end time.

**Corrections**

Driver : YYYYYY yyyyyy

Modified Result		Origin Result	
Laps:	18	Laps:	0

Print Save Cancel

It is possible to correct single laptimes. Just select "edit laps" from the right click menu and then you can correct the time by entering the value in milliseconds.

**Laptime editor**

**Laptime**

Current Laptime 00:00.781

Correction to original lap time 00:00.000

**Correction**

Correction in milliseconds (+/-) 0

Manual entry of the new lap time 00:00.781

Ok Cancel

The field commentary is used for additional remarks. You can enter pre defined records by clicking on the button at the end of the line. Just click on the record you need.

After a correction all necessary reports and ranking lists will generated. This makes sure, that the rankinglists are always actual.

If you have made some wrong corrections by mistake, you can cancel these by clicking on the restore button.

On the printouts corrections are marked by only one character:

L means correction of laps

E means correction of the time

B means correction of best time.

## 9.9 Punishments

Right clicking on a driver in the race overview shows you a submenu where you can select punishments. A window similar to the correction window opens. Here you find punishments based on the rules of EFRA and IFMAR as well as some other federations.

Warnings can be entered and are saved. Therefore you know at any time how many warnings a driver has. You can cancel all punishments by using the button right of the punishment button.

Punishments		
00:00:00	Penalty	
00:00:00	Stop & Go	
1	Best Heat	
	Exclusion	
	Disqualification	

RCM Ultimate can handle the following punishments:

**Penalty:** This is a time penalty and the time must be entered left of the penalty button.

**Stop & Go:** This is used if a driver was not able to complete stop & go penalty. Left you have to enter the amount of seconds. The configured time in seconds at the left side will be reduced and the laps decreased by 1, when the seconds are higher than the end time after the race duration. Otherwise the time will be added.

**Time of best heat:** The time set is added to the result of the best heat.

**Laps on best heat:** The number of laps set are subtracted from the best heat.

**Best heat:** The best heat of a driver will not be counted. This is calculated new after each round of heats. This option can be used repeatedly, for example if you do not want to count the second best result of a driver too. In this case, please set the number of best heats to cancel in the left input-field.

**Exclusion:** The result of this heat will be set to zero.

**Disqualification:** The driver will be excluded from the whole race. The results are not in the ranking list. The disqualification can be set in any time. When you do this during qualification the driver will not be in the ranking list and cannot drive the finals. When you do this in finals the driver can not move up into the next final, the next best driver will move up. When you disqualify a driver at the end of a race the driver will be eliminated from the ranking list and the following drivers move one place up.

**Warnings 1 - 3:** You can write a comment for official warnings. The warnings are stored and it is visible at any time how many warnings a driver already has.

Officials Warnings	
1	Unfai driving I
2	
3	

**Automatic Commentary:** All punishments will automatically recorded and result in a automatic commentary in the Jury notes. This comment will be printed on the result sheet.

**Commentary:** Additional commentary can be added and is registered on the result sheet.

## 9.10 Rerun a heat

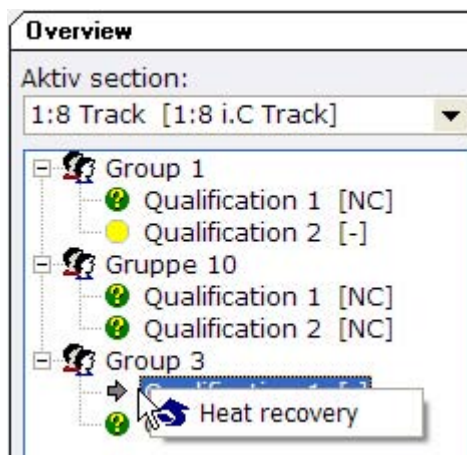

If you have to rerun a heat/final (for what reasons ever), you have to select the heat in the overview in the right column. Before you can start this race again, you have to click on the clear race button.

You have to confirm the question "really to clear the race" by clicking on the ok button before the results of the already finished heat will be deleted. Now you can rerun the heat/final.

## 9.11 Power failure

After a power failure or a abnormal end of the program the result of the last heat run can be recovered to the last counted laps. Restart RCM Ultimate, load the event and select the timekeeping. Now click right in the menu of the heats on the heat in question. Am menu appears where you can select "heat recovery". Now you see the result of the heat as it was when the power failure occurred. Now click right again on the heat and select "rebuild report". Now you can print the result at the time of the power failure as usual.

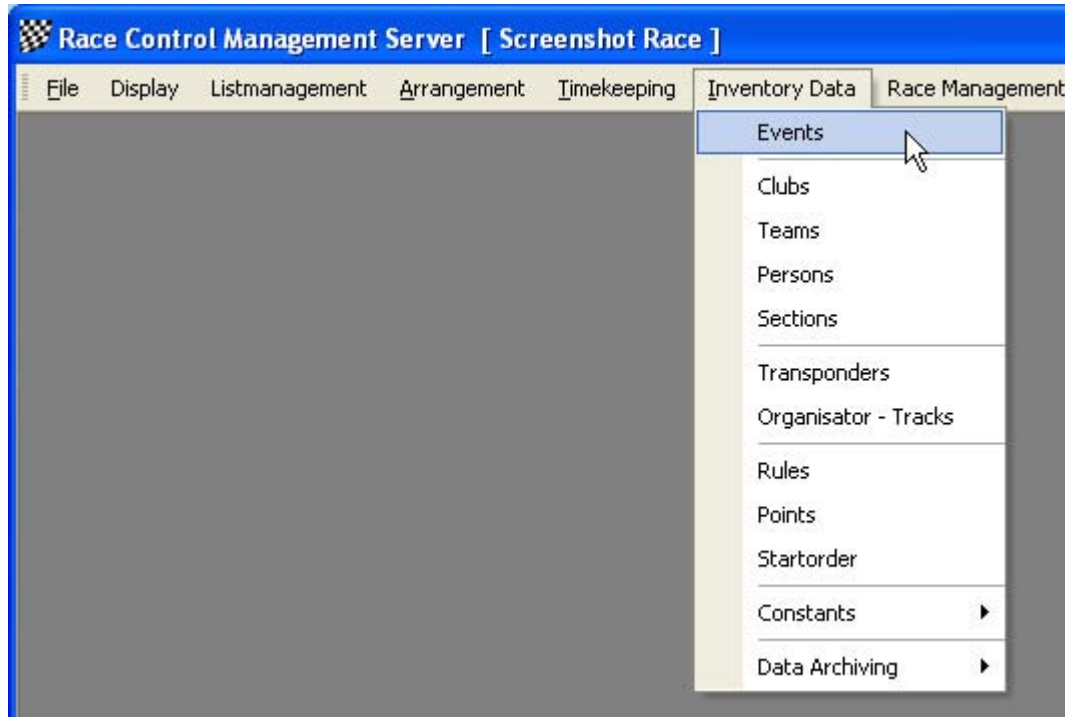

## 9.12 Transponder black list

The program is now equipped with a black list of stolen transponders. The transponder written down in this list will not be counted anymore. This list is maintained by RC-Timing and can not be edited with the program.

## 10 Inventory data

The care of the inventory data is one of the most important things for a database. The inventory data has to be up to date and complete as much as possible. It is much easier to run events in the future, if the data of the sections, of the rules, of the organizer and so on are completely registered.

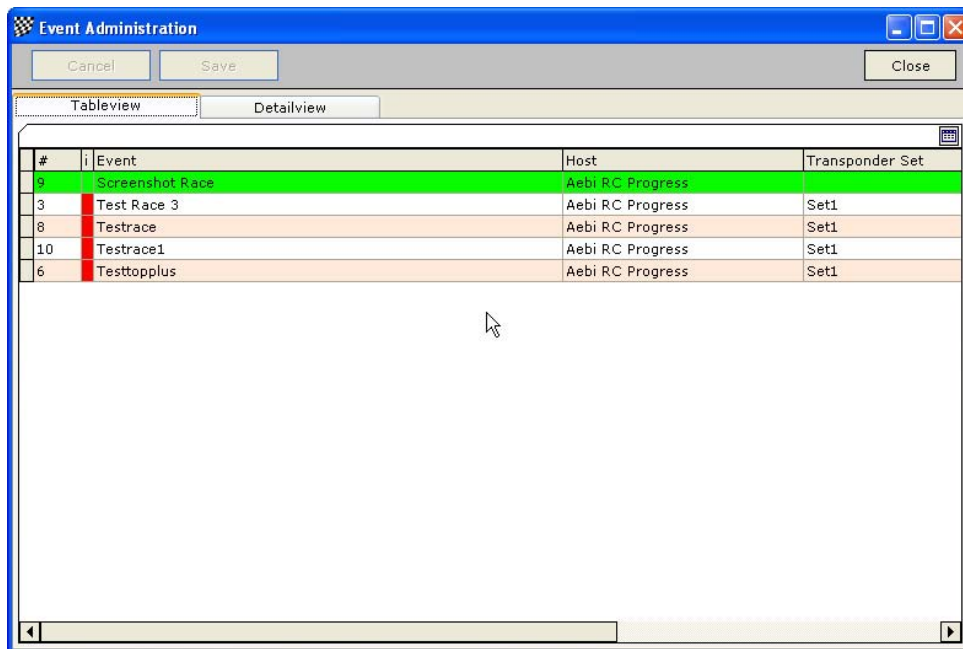

Through the inventory data menu the following functions for the administration is available:

- \* Edit Events. For creating a new event you have use the file menu.
- \* Edit or create clubs, this is a optional information to associate a driver with a club.
- \* Edit or create teams, this is a optional information to associate a driver with a team.
- \* Edit or create the personal data of the drivers.
- \* Edit or create a section. It is mandatory that you have sections combined with a rule, please create first a rule then a section.
- \* Edit or create transponder sets, this is optional if you have a rack with rechargeable transponders for hand out.
- \* Edit or Create organizer/host and track data.
- \* Edit or create rules to lead through the race automatically from qualifications to the final.
- \* Edit and create point schemas for use with the championship editor.
- \* Edit and create a certain starting order.
- \* Edit and create constants like country codes, frequencies and associations.
- \* Archive the personal data.

## 10.1 Events

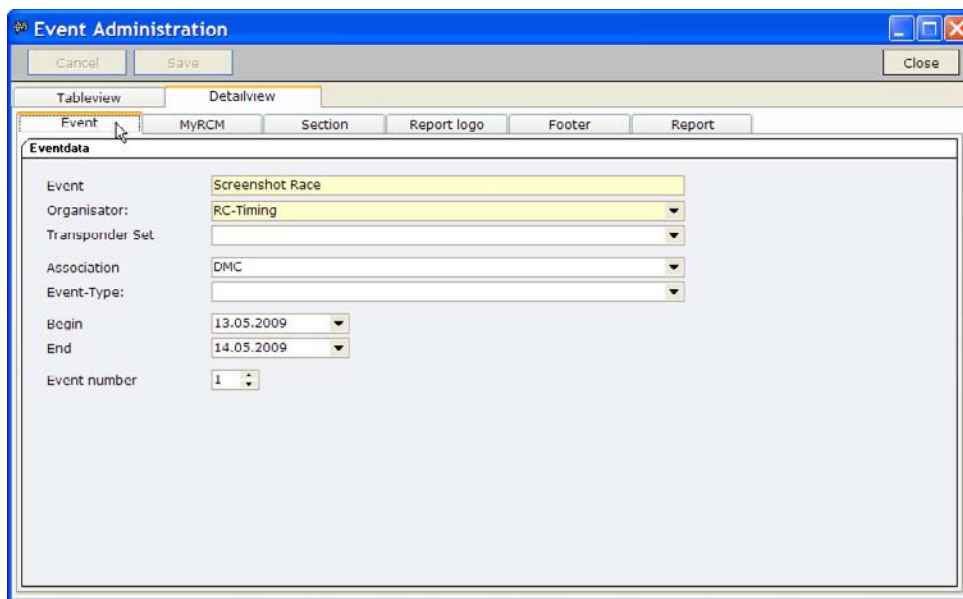

The event window displays all events, which have been run sometimes with this program. The events with a red mark are stored in the archived data. The green marked event can be loaded directly from the database. If the whole row of an event is marked green, the event is already loaded. Create a new event, delete an event or close an event can only be done in the file menu. Here you can only edit the data.

### 10.1.1 Details of an event

Double clicking on the event or using the detailview tab shows the detailed data of the event.

Event: This is the title of the event. Do not use the date or the different sections you run. This is the general name of the event.

**Organisator:** This is the organizing club or a person, which hold the event. It is necessary, that the club/person is already entered in the database. If you click on the down arrow right at the box you can select the organizer from all the clubs/persons already saved in the database.

**Transponder Set:** Usually an organizer owns a transponder set to handout to drivers which have no personal transponders. To work with a transponder set, the name of the set as well as all transponder numbers have to be entered in the inventory data. You can change the name of the transponder set later.

**Association:** If the event is run under a association or federation, the name can be entered here.

**Event-Type:** The type of the event, for example National Championship.

**Begin:** Date of the start of the event.

**End:** Date of the end of the event. If the event lasts only one day, Begin and End is the same date.

**Event-Number (Laufnummer):** If the event counts to a championship, the number of the round have to be entered here.

### 10.1.2 Details on MyRCM

**Publish event on MyRCM:** If the time keeping computer have access to the internet and you want to publish the results on MyRCM, this feature should be activated. Please note, that in Settings/WWW an ftp-connection must be enabled.

**Event Administration**

Cancel Save Close

Tableview Detailview

Event MyRCM Section Report logo Footer Report

**MyRCM Service**

- ☒ Publish Event and Eventdata (reports) on www.myrccm.ch
  - ☐ Use local teams for registration
  - ☐ Use local clubs for registration
- ☒ Activate race registration
  - 30.12.189 to 30.12.189
- ☒ Activate waitinglist
  - ☐ Show waitinglist
  - 120 Maximum number of egristrations in active list
- ☐ MyRCM account required for registration

Further on you can select several information:

**Use local teams for registration:** The name of the team is compared with the local entered team names

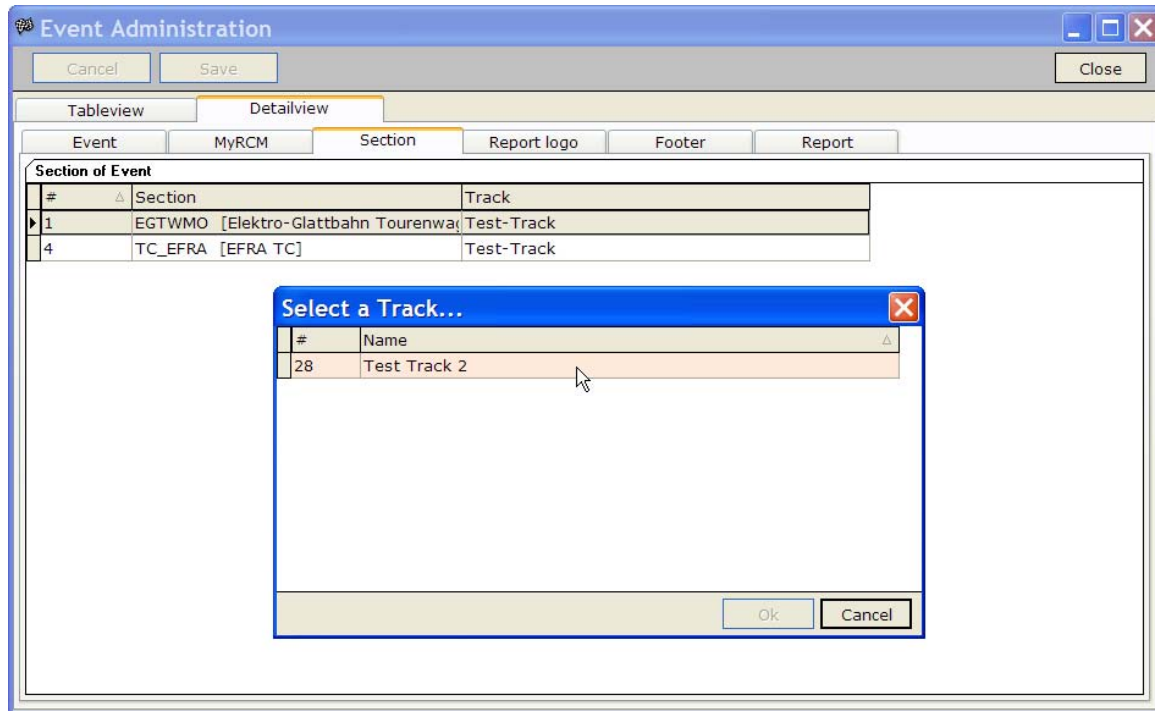

**Use local clubs for registration:** The name of the club is compared with the local entered club names.

**Activate race registration:** The registration on MyRCM is activated. You can determine the time period who long the registration is active on MyRCM. You can also activate a waiting list and you can say how many registrations are accepted.

Finally you can select whether a MyRCM account is necessary for the registration or not.

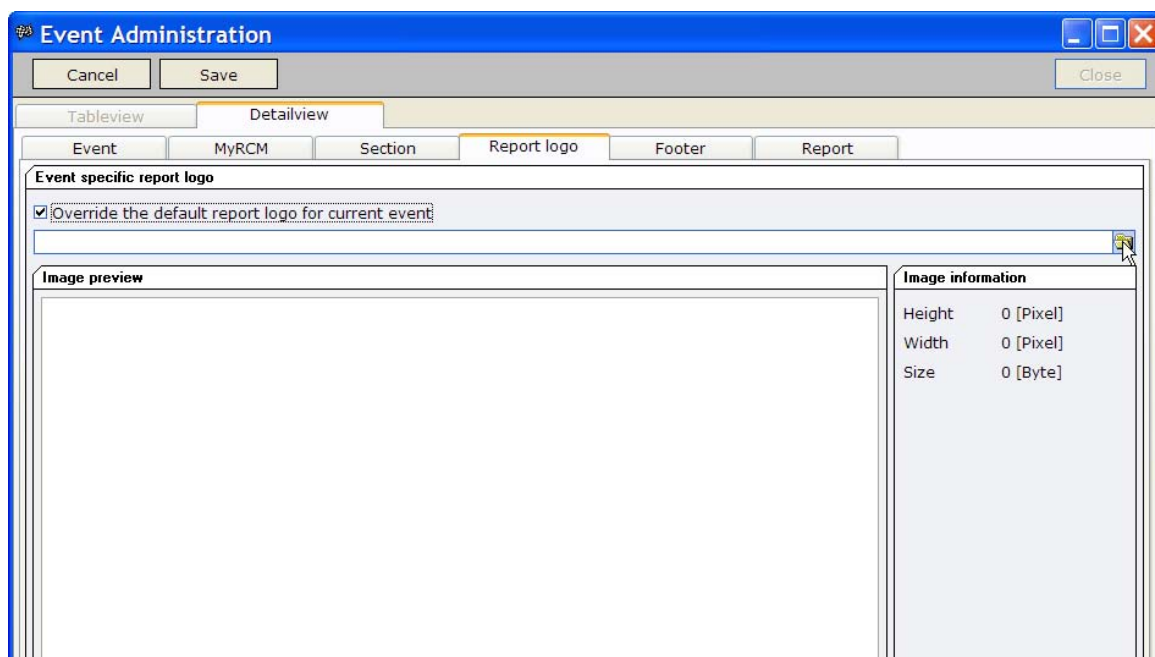

### 10.1.3 Details of the section

Clicking on the section tab shows to you all sections of this event and on which track the section will be raced. Here you can only change the track. Double clicking on the section allows you to choose the track (if more than one track is assigned to the organizer). Adding or deleting sections can only be done in the list management menu.

### 10.1.4 Details of Report Logo

You can replace the default logo only for this event. Activate "override the default report logo for current event" and click at the end of the input-line on the now activated button. Now you can load a logo which is used only for this event. This logo is shown on the RCM Publisher and Web-Publisher.

### 10.1.5 Details of Footer

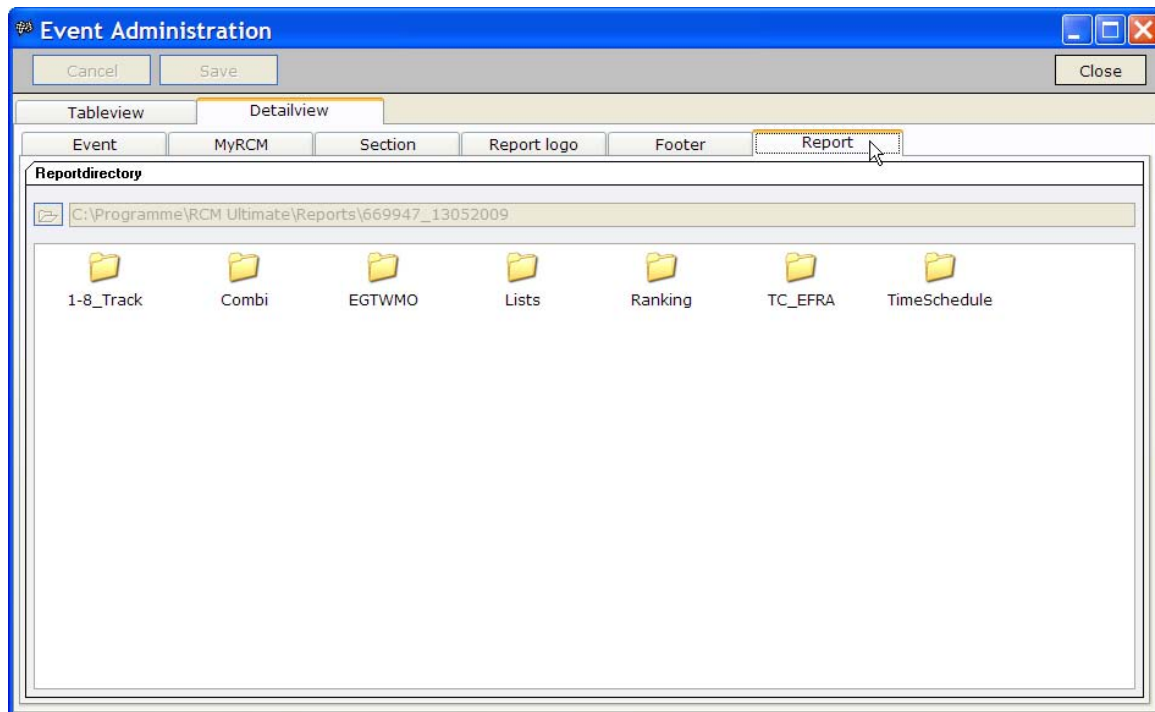

Here you enter the names of the officials of the Racedirection, timekeeping, sportcommission (jury) and technical inspection. These will be printed at the bottom of every report.

The screenshot shows the 'Event Administration' window with the 'Footer' tab selected. The window has a blue title bar and standard Windows window controls. Below the title bar are 'Cancel', 'Save', and 'Close' buttons. The main area contains a tabbed interface with 'Tableview' and 'Detailview' tabs. Under 'Detailview', there are sub-tabs: 'Event', 'MyRCM', 'Section', 'Report logo', 'Footer' (selected), and 'Report'. The 'Footer' sub-tab displays a section titled 'Values for report footer' with four input fields for 'Racedirector', 'Timekeeping', 'Sportcommission', and 'Technical Inspection'. A mouse cursor is visible over the 'Technical Inspection' field.

### 10.1.6 Details of the reports

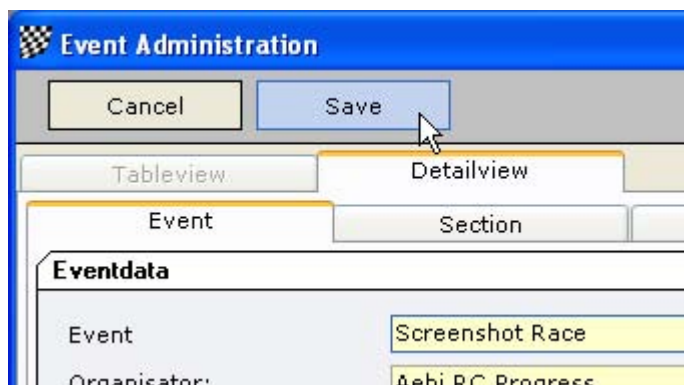

The report tab shows you the folders where the reports are saved. There is one folder for each section. The folders are used like in the Windows Explorer. If you have a web browser installed on your computer you can view the reports by double clicking on the file.

Here you can check if the reports are existent when the program send a message to you like "can not find a report" or "data not available".

### 10.1.7 Save

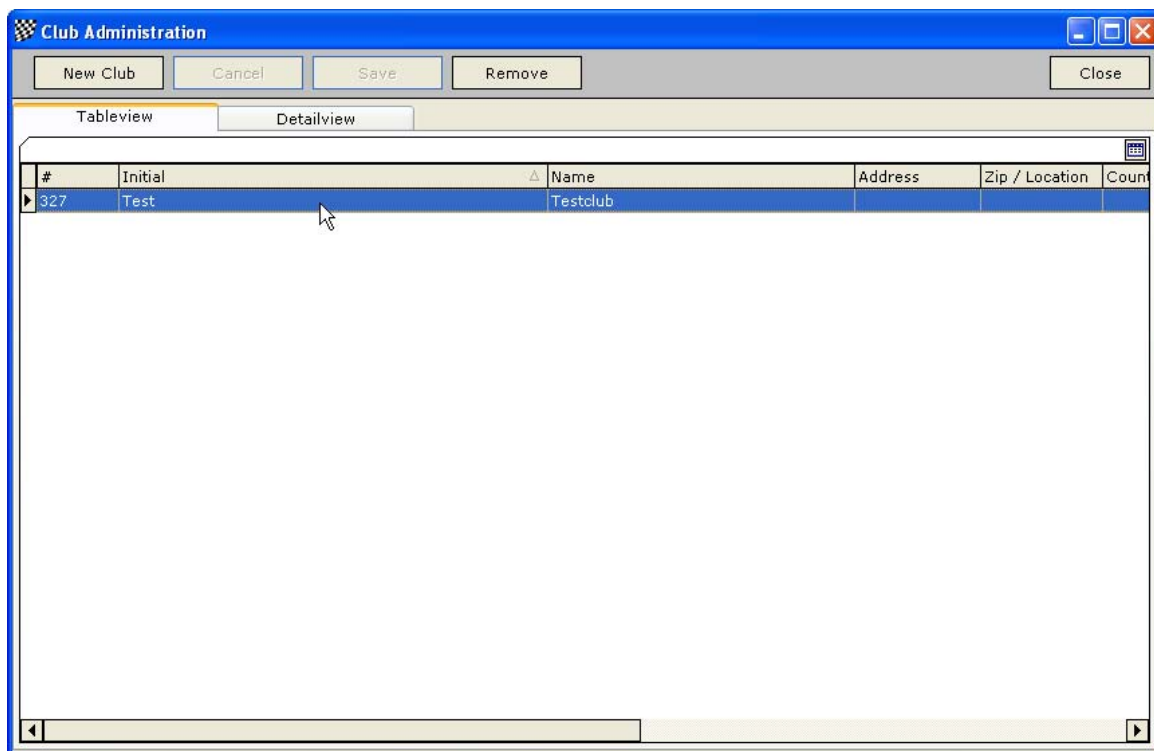

If you have made an changes, please click on the save button on top of the window before you close the window.

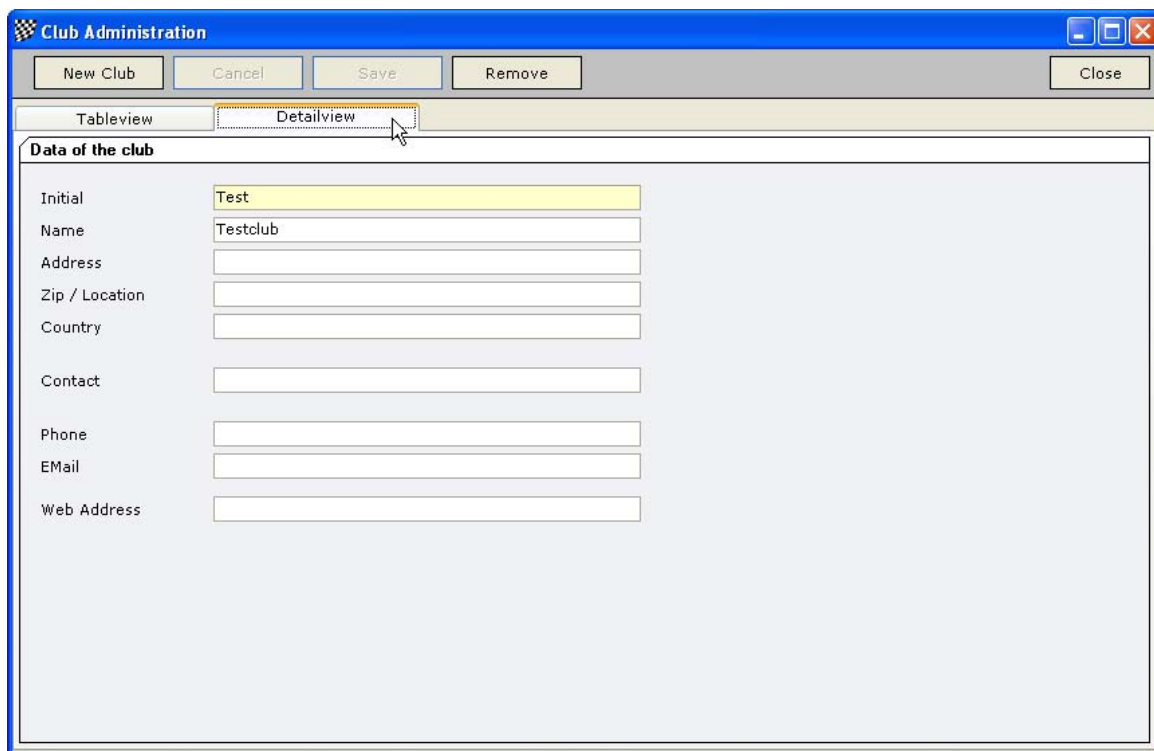

## 10.2 Clubs

The club menu shows you all clubs which are stored in the database. You can change the data, add a new club or delete a club. The club data is not mandatory, it is only used for information purposes. If you have entered information of a club, you can assign the club to a driver.

For a club you can enter the name, a nickname, the address, a contact person, telephone number, email-address and website.

## 10.3 Teams

The team menu shows you all teams which are stored in the database. You can change the data, add a new team or delete a team. The team data is only mandatory, if you use the teamcup-features. If you have entered information of a team, you can assign the team to a driver.

#	Name	Address	Zip / Location	Country	Contact	Phone

## 10.4 Persons

All data of a driver and the related sections are entered in the inventory data.

The screenshot shows the 'Personal Administration' window. On the left is a tree view under 'Inventory Data' with a list of placeholder names. The main area is divided into two sections: 'Inventory Data' (a table) and 'Pilot Data' (a form). The 'Inventory Data' table has columns: Name, Club, Block, Country, Address, Location, and Zip. The 'Pilot Data' form has fields for Lastname, Firstname, Address, Location, Country, Phone, EMail, Birthday, Block Initials, and Club. At the bottom, there is a 'Status Information' section with fields for Data records, ChipDrive Status, and ChipCard Status.

### 10.4.1 Personal data

From the list in the right or the left column you can select the person. Left clicking on a person in a list will display the personal data in the lower part of the right column. There you can correct the data. Please note, that if you change or add some data, you have to save it before switching to another person. If a driver is not in the database, you can create a new entry by clicking on the new person button on the top left edge of the window.

This screenshot is similar to the previous one, but the 'New Person' button in the top left corner of the window is highlighted with a mouse cursor. The rest of the interface, including the 'Inventory Data' table and 'Pilot Data' form, remains the same.

The list of the master data can be searched and navigated as described in chapter 4 in this handbook. By the way, all sorting definitions will be deleted if you close the window and reopen it.

The pilot data in the lower part of the right column is divided in two parts: The particular tab shows all personal data.

The screenshot shows the 'Personal Administration' window. On the left is a tree view under 'Inventory Data' with a list of placeholder names. The main area is divided into two sections. The top section is a table with columns: Name, Club, Block, Country, Address, Location, and Zipcode. It contains several rows of placeholder data. The bottom section is titled 'Pilot Data' and has two tabs: 'Particulars' and 'Licence'. The 'Particulars' tab is active, showing fields for Lastname, Firstname, Address, Location, Country, Phone, Email, Birthday, Block Initials, and Club. A mouse cursor is pointing at a small icon in the top right corner of the 'Particulars' tab. At the bottom of the window, there is a 'Status Information' bar showing '23 Data records', 'ChipDrive Status: Not Found', and 'ChipCard Status: Removed'.

Here you can enter name (this is mandatory), address, telephone number, email-address and birth date, the block and the membership of a club. Further on you can affiliate a picture with the driver. Just click on the open button right in the driver data windows. The picture should respect to the following conditions: 150 x 170 pixel, 96 dpi, bmp- or jpg-format.

The license can be related to a section and/or to a person. This depends on the data entered in a section. If a license is necessary for a section, the license data is available through the section data. If you race at least one section, where no section license is necessary, you can enter the license information in the pilot data with the license tab. Here you can enter the license number, an add on text, the country code and the licenser. Activating the license box means, that the driver has a license.

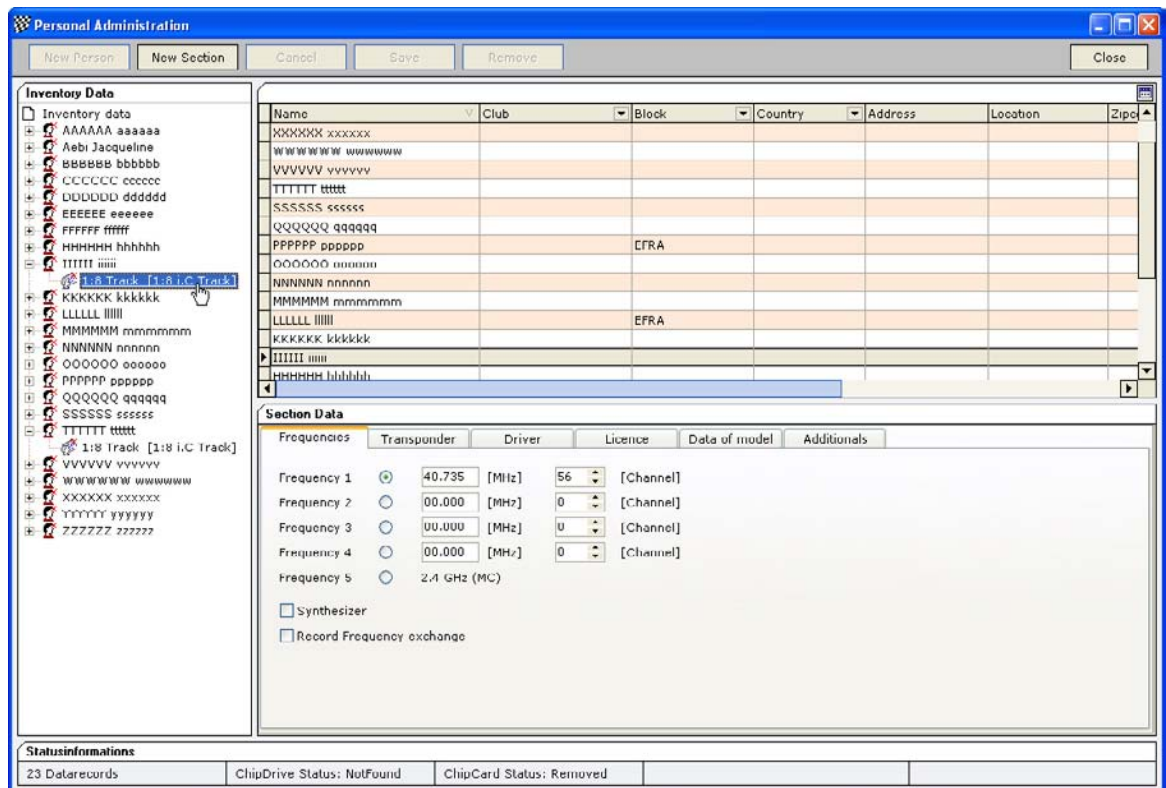

This is a close-up of the 'Pilot Data' window, specifically the 'Licence' tab. It features a 'Licence' checkbox which is currently unchecked. Below the checkbox are four text input fields labeled 'Licence Nr.', 'Licence AddOn', 'Country ISO Code', and 'Licenser'. A mouse cursor is hovering over the 'Licence' checkbox.

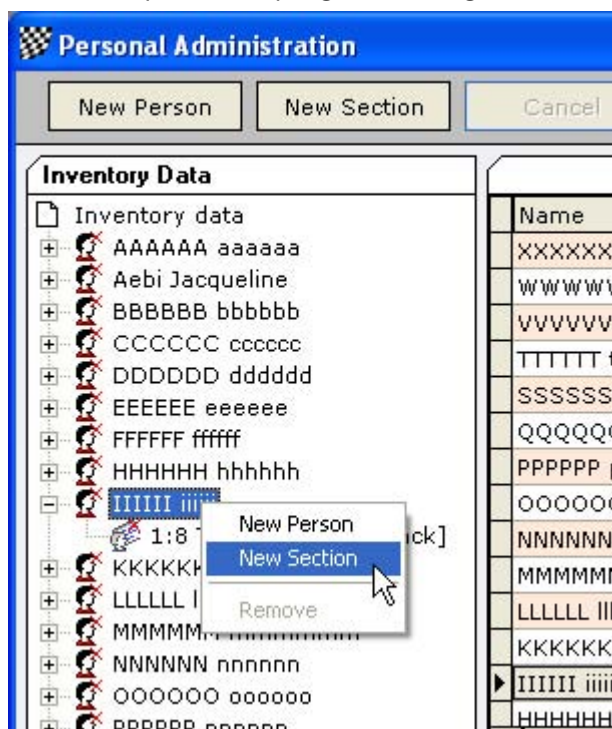

Please note, that you have to save all changes before moving to another person.

## 10.4.2 Section based personal data

A selected person of the main list is also highlighted in the left column. Drivers marked with a + sing in front are related to sections. You can add a section to a driver by right clicking on his name and selecting new section.

You can also use the new section button on the top of the window. If you mark the persons by clicking while holding the Ctrl-Key pressed you can assign a section to all highlighted persons. Clicking right on a section of a driver you can adopt the data of another section. Deleting a section from a driver is also been done with the submenu you see by right clicking on the section.

If you click on a section of a driver, you will see the section data related to that driver on the lower right column. Frequencies, transponders etc. can be entered for this section.

**Section Data**

Frequencies	Transponder	Driver	Licence	Data of model	Additional
Frequency 1 <input checked="" type="radio"/>	40.735 [MHz]	56 [Channel]			
Frequency 2 <input type="radio"/>	00.000 [MHz]	0 [Channel]			
Frequency 3 <input type="radio"/>	00.000 [MHz]	0 [Channel]			
Frequency 4 <input type="radio"/>	00.000 [MHz]	0 [Channel]			
Frequency 5 <input type="radio"/>	2.4 GHz (MC)				
<input type="checkbox"/> Synthesizer <input type="checkbox"/> Record Frequency exchange					

Under the frequency tab you enter the frequencies the driver is using. Alternatively you can enter the frequency in MHz or the channel number. RCM Ultimate allows you to store four frequencies and a multi channel system. If you enter the frequencies the first time, the first frequency will automatically marked as being used. This is marked by a green dot in the circle left of the frequency. If the drivers uses another frequency, just click in the circle left of the correct frequency. Further on you can enter if the driver uses a synthesizer radio control and if frequency exchanges should be recorded.

**Section Data**

Frequencies	Transponder	Driver	Licence	Data of model	Additional
Transponder 1	1234561				
Transponder 2	1234560				
Transponder 3	0				
Transponder 4	0				
Temporary TX	0				

The transponder tab allow you to enter four personal transponder and one temporary transponder. The box temporary transponder will be used for the hand out transponder of your club. The temporary transponder is exactly the same as the personal transponder, but RCM Ultimate offers a subroutine to delete all entries of the temporary transponders at the end of a race day.

The use of temporary transponders only works properly, if the transponders are entered as a transponder set and the use of the transponder set is set to inactive (please refer to the tools menu). If a transponder not registered to a driver passes the loop the transponder number can be assigned to a driver. The program recognize if it is a personal or a temporary transponder.

The data under the driver tab are optional, but can make the race organization easier and contain further information:

**Mechanic:** If another driver acts as a mechanic for this driver, you should enter here the name of the driver. RCM Ultimate avoids to arrange these both drivers in the same group.

**Team:** If you use the teamcup-functions, the team must be entered here.

**Skills:** RCM Ultimate supports performance categories. You can enter a value between 1 (Expert) and 1000 (Amateur). The skill can be used for the arrangements of heats.

**Level:** You can organize the drivers of a section into different levels. This can be used for the heat arrangement as well as the final ranking lists. Just select the level from the list.

**Achievement 1 and 2:** Here you can enter good results of the driver.

**Sponsor:** This is for information only.

**Age group:** here you can enter the age group for the driver in this section. The definition can be selected from default values.

The licence tab is only available, if section licenses are used. The data to enter is the same like in the personal data.

The tab Data of model allows you to enter information about the products used by the driver. Information about the car, engine, body, tires, transmitter and batteries can be entered. In addition you can save a picture of the car. The format of this picture should be: 260 x 140 pixel, 96 dpi, bmp- or jpg-format.

Under the tab additional you have the possibility to enter technical complaints with a comment.

Tableview Detailview

**Sectiondata**

Code 1:8 Track

Sortindex 1

Name 1:8 i.C Track

Rule 1:8a

EFRA Section ☐

Licence required ☒

In the detail view you can enter the following data:

Code: Nickname for the section.

The sorting of the sections can be done by Drag&Drop in Listmanagement/Sections.

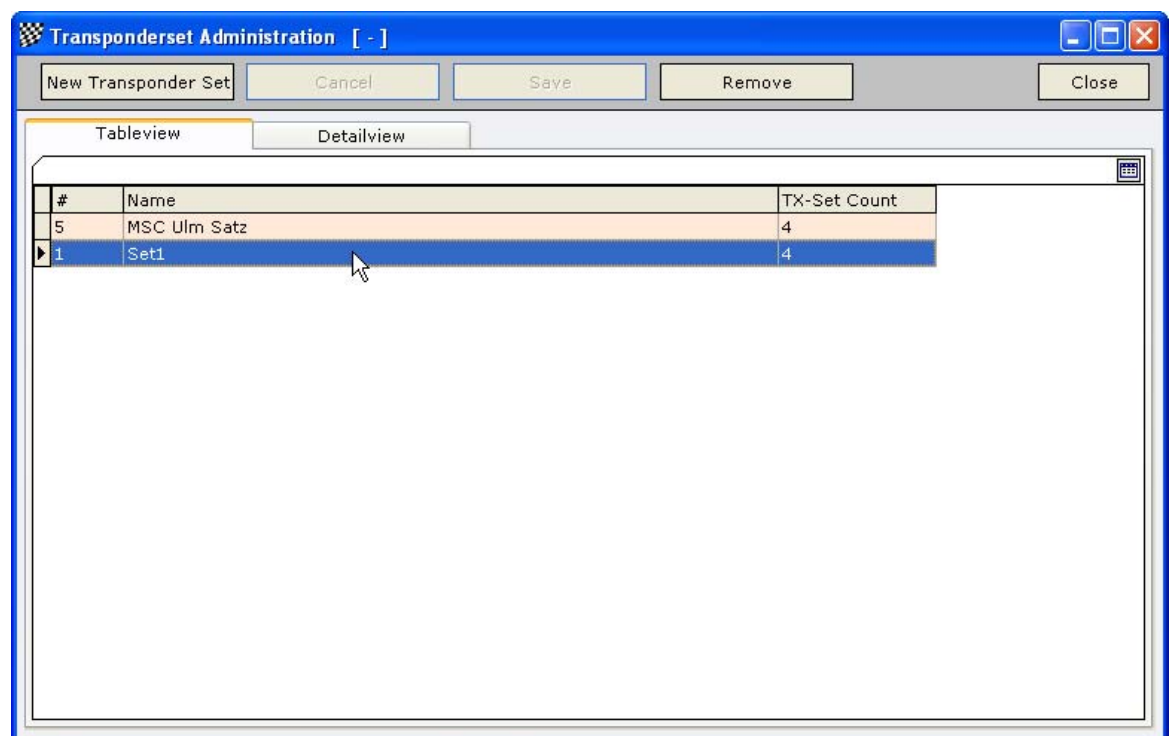

Name: Name of the section in detail.

Rule: According to which rule the section is run. It is necessary that a rule is entered and that this rule exist in the database. It must be already defined in inventory data/rules.

License required: If activated, the license data are assigned to the section and must be entered to the personal data in the sectiona area.

## 10.6 Transponder

Here you can enter the club transponders for hand out to the drivers not having a personal transponder.

First you have to create a new set using the new transponder set button. After that you have to give the set a name.

Using the detail view tab you can enter the transponder numbers in sets of 10.

The screenshot shows the 'Transponderset Administration' window with the 'Detailview' tab selected. The window has buttons for 'New Transponder Set', 'Cancel', 'Save', 'Remove', and 'Close'. Below the tabs is a 'Transponder Set Data' section with a 'Set Name' field containing 'Set1'. Underneath is a 'TX Series' section with a list of series (Serie 1, Serie 2, Serie 3, Serie 4) and a 'memo-pad' button (a square icon with a plus sign). To the right of the series list is a table with 10 rows, each representing a transponder number (Nr. 1 to Nr. 10). Each row has three input fields: 'Transponder Nr.', 'Car Nr.', and a direction indicator ( '--> '). The 'Transponder Nr.' field for Nr. 1 is filled with '111111111', and the 'Car Nr.' field is filled with '1'. The other rows have empty 'Transponder Nr.' fields and 'Car Nr.' fields filled with numbers from 2 to 10. The 'Transponder Nr.' field for Nr. 5 is filled with '0'.

Default is one series. You can add a second series to your set by clicking on the "memo-pad" button (upper button just right of the windows where the series are listed). Please save your work before closing this window.

The transponder set marked green in the table view is the active transponder set. Please save your work before you close this window.

## 10.7 Organisator - tracks

### 10.7.1 Organizer

Organizer are the clubs or persons hosting an event. It is important to have at least one track assigned to an organizer.

The screenshot shows the 'Track Administration' window with the 'Host data' tab selected. The window has buttons for 'New Host', 'New Track', 'Cancel', 'Save', 'Remove', and 'Close'. On the left is a 'Host' tree view with a folder icon and the following items: '[2] Aebi RC Progress', 'Test Track', 'test 4', and '[1] test'. The 'Host data' section on the right contains a form with the following fields: 'Initial' (filled with 'RCP'), 'Name' (filled with 'Aebi RC Progress'), 'Address' (empty), 'Zip / Location' (empty), 'Country' (empty), 'Contact' (filled with 'Jacqueline Aebi'), 'Phone' (empty), 'E-Mail' (empty), and 'Web Address' (empty).

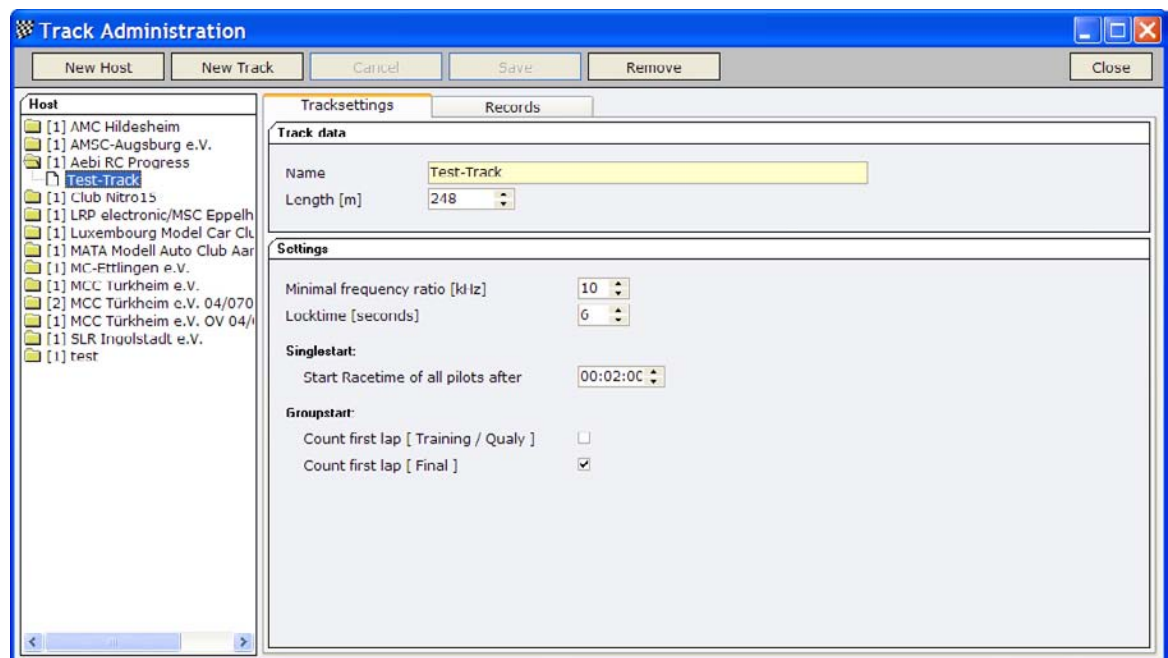

In the left column of the window all organizer are displayed. The number in brackets is the number of the tracks of an organizer. To see the details of an organizer just left click on the name in the list. To create a new organizer use the new host button on the top of the window. At least you have to enter a name - the other fields are not mandatory.

Remark: Without organizer and tracks it is not possible to create an event.

## 10.7.2 Tracks

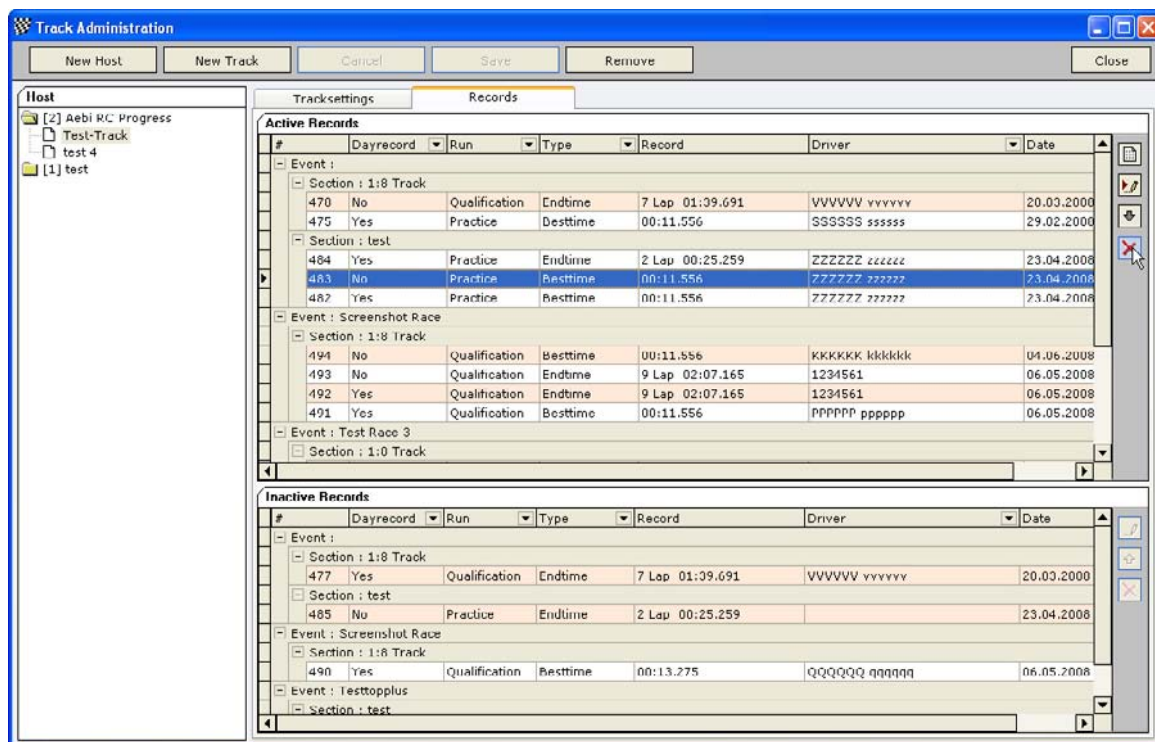

Just click on the organizers name in the left column and you see the tracks just below the organizer. If you want to create a new tack, use the new track button on top of the window. This will assign a new track to a organizer. Left clicking on a track will display in the right column the details of the track.

The length of the track is only for information but the minimal frequency ratio is used for the arrangements of the heats and to detect frequency conflicts. Also important is the locktime for the time keeping to avoid very short lap times. Singlestart: Start racetime of all pilots after : Here you can set the time, after the clocks of all drivers are started after the start of a heat, regardless is a car has passed the loop or not.

Whether the first lap is counted or not depends on the track and is only valid for groupstarts. Counting the first lap can be set different for Practice/Qualification and Finals.

With the Records tab the saved records of the track are displayed.

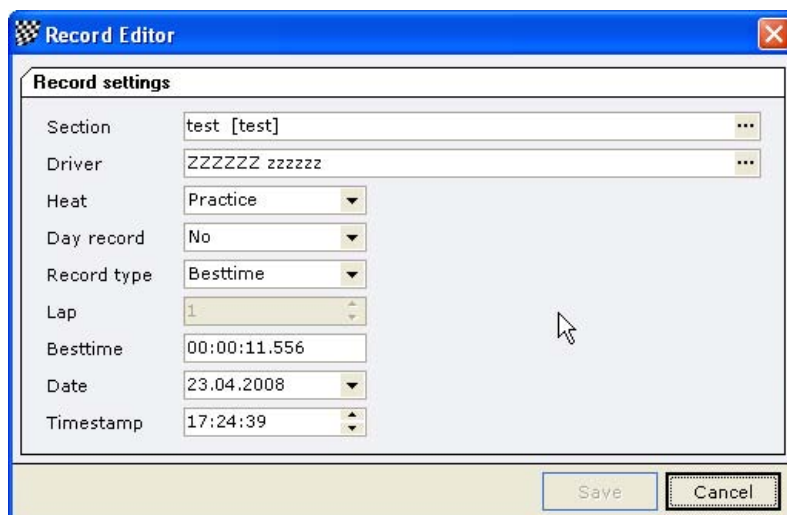

In the lower part of the right column the historical records and in the upper part the actual records are displayed.

Remove a record: You mark the record in the upper or in the lower list and click on the cross-button right of the table.

Deactivate records: You should preferable use this function instead of removing records. Mark the record in the upper list and click on the arrow down button right of the list. This moves the record to the list of inactive records. If in a race new records have been run, RCM Ultimate sets the old records to inactive and adds the new records to the active records list.

To reactivate a record from the inactive records list mark it in the list and click on the arrow up button right of the list.

Further on you can edit the records as well as add new records. If you want to add a new record, click on the notepad-button on the left and the input dialog for the new record appears. If you want to edit a record, click left on the report and then click on the pencil-button on the left. The details of the record will be displayed and you can edit these.

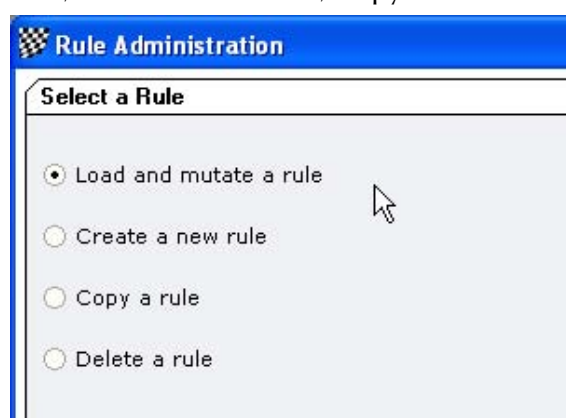

## 10.8 Rules

A rule describes the sequence of the practice and qualification heats as well as the finals. It is the most important configuration for the race procedure. We recommend to use one rule for a section. Even if two sections are using the same rule it is recommended to use two rules.

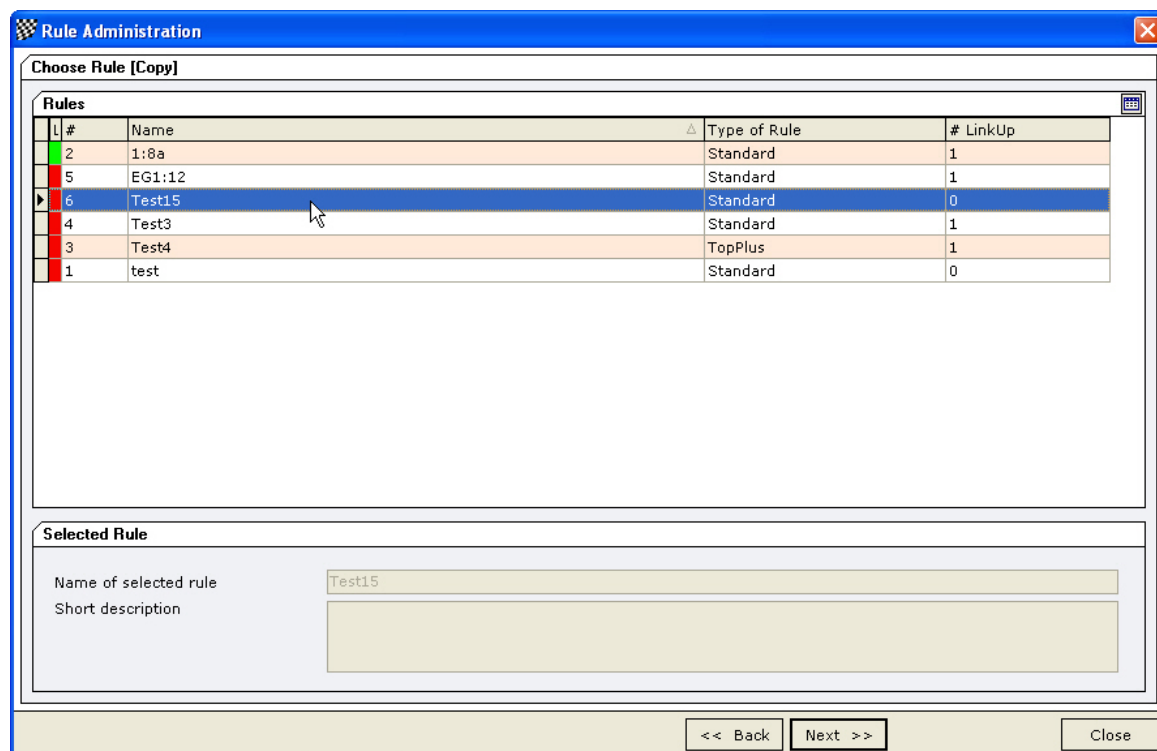

The rules include information on the number of drivers per heat, the race times, the scoring of the results and the move up in the finals. The setting of a rule is also used to generate the time schedule. A wizard leads you through all definitions of the rule. But it is important, that you know the rule exactly and check your inputs carefully.

### 10.8.1 General about rules

First of all you have to make a selection whether you want to mutate an existing rule, create a new rule, copy a rule or delete a rule.

The selection leads you to window with a table of all existing rules. Left click on the rule and click on the next-button.

Load and mutate a rule: You can select a rule and change or check this rule. If you change the name of the rule, the name will also be changed in all sections assigned to this rule.

Copy a rule: An existent rule will be copied to a new name. First you have to select the existent rule and then you have to enter the new name.

When copying a rule, you have to type in the new name in the lower part of the window.

Delete a rule: the selected rule will be deleted. If you delete a rule, you can only execute delete after marking the rule. Before the rule will really deleted you will be asked once more, if you really want to delete the rule.

Create a new rule: First you have to enter a name for the new rule and you can configure the rule.

There are three basic types of rules available: Standard, Combination and Top Plus. Standard is used if the rule is applied to all drivers. Combination means, that two or more sections can be raced together. You can define whether the practice,, the qualification and the finals are raced together. Top Plus means that the drivers are divided in two shares after practice or qualification (according to the ranking list). You can set different rules for the top drivers and the lower drivers.

To run several sections together please proceed as follows:

1. Set up the rules for the the separate sections.

The screenshot shows a window titled "Rule Administration - KomboPro10EGTWMOD". Inside, there is a section titled "Top Plus Rule". Below this title, there is a list of sections (Section 1 to Section 6) with corresponding text boxes and buttons. Section 1 is "EGPRO10 [Elektro-Glattbahn Pro 10]" and Section 2 is "EGTWMO [Elektro-Glattbahn Tourenwagen Modified]". Sections 3, 4, 5, and 6 are empty. Below the sections, there is a table with two columns: "Together" and "Separated". The rows are "Training", "Qualification", "Final", and "Eventrankinglist". The "Together" column has radio buttons, and the "Separated" column has radio buttons. The "Together" column is selected for "Training", "Qualification", and "Eventrankinglist", while the "Separated" column is selected for "Final". At the bottom of the window, there are buttons for "<< Back", "Next >>", "Save", and "Cancel".

	Together	Separated
Training	<input checked="" type="radio"/>	<input type="radio"/>
Qualification	<input checked="" type="radio"/>	<input type="radio"/>
Final	<input type="radio"/>	<input checked="" type="radio"/>
Eventrankinglist	<input checked="" type="radio"/>	<input type="radio"/>

If you select Top Plus Rule a window opens where you can set the rule for the top section and the Plus section. You can define which heats will be run together. Further on you have to input the number of drivers for the Top section and the number of drivers for the Plus section.

The screenshot shows the 'Rule Administration' window with the 'Top Plus Rule' tab selected. The window contains the following fields and options:

- Rule for Top Section:** A text box containing '1:8a'.
- Rule for Plus Section:** A text box containing 'Test4'.
- Together / Separated:** A table with two columns: 'Together' and 'Separated'. The rows are 'Training', 'Qualification', 'Final', and 'Eventrankinglist'. The 'Together' column has radio buttons, and the 'Separated' column has radio buttons.
- Number of Top Section Pilots:** A text box containing '1' and a dropdown menu showing '38'.
- Number of Plus Section Pilots:** A text box containing '39' and a dropdown menu showing '0'.
- Buttons:** '<< Back', 'Next >>', 'Save', and 'Cancel'.

## 10.8.2 Validation of the rule

Several configurations depend on other values. For example it is not possible to count more heats than raced. Such errors are logical errors and will be displayed in magenta.

Several inputs have to be in a specific range. For example the number of drivers per heat can not be 0 or the race time can not be 0. This mistakes are marked blue. All errors must be corrected before you can go on.

### 10.8.3 Practice rules

General: To run the race with practice heats you have to activate “with”. If non is activated, you can not start any practice heats and you can not arrange practice heats.

Heats end after: Time: The heats will be finished after a specific time. Times or laps: The heats will be finished after the number of laps or after the race time is over.

Laps: The heats will be finished after a specific number of laps.

Start with: RCM Ultimates offers to you several start modes. Please refer to the chapter “start modes”.

Practice ranking list counts for: The scoring of the practice ranking can be determined by laps and time or by the best laptime of a driver.

Practice rankinglist will be added with points: Yes: The heats will be counted by points. This means, that each round will be counted by laps and time, this ranking is the basic for a point ranking. The point rankings from the different rounds results in the final qualification result. No: The qualification ranking will be determined by laps and times.

Startorder for the next practice run: You can select whether the starting order is done according to the car numbers, according to the actual ranking list (overall ranking list), according to the result of the last heat or according to a configured starting order (this order can be set in the inventory data).

Depending on the values you entered, you will be led to one or two more windows to enter more details for the practice heats.

**Rule Administration**

**Preferences of Practice**

Maximum drivers per Training Heat: 10

Duration of practice: 00:01:00

Heat is over after number of laps: 0

Number of Practice Run: 3

**Maximum driver per training heat:** This is the maximum number of drivers in each heat used at the arrangement of practice heats.

**Duration of Practice:** time for each practice heat.

**Heat is over after number of laps:** If the heats are finished after a specific number of laps, enter the value here.

**Number of practice run:** Enter the number of rounds for the practice.

**Number of counted practice run:** Enter the number of the best heats being counted for the practice rankinglist. Setting to 1 means that only the best heat is counted, 2 means, that the two best heats are counted.

**Number of counted best lap times:** If you have selected, that the rankinglist is timed with bestlap, you can enter here the number of best laps to be counted.

**Delaytime at single start:** If you have selected "Single Start with Delay" you have to enter the delay time here.

**Intervalltime at single start:** If you have selected "Single Start with Interval" you have to enter the interval time here.

**Follow-up Time after race end:** This is the time the timekeeping systems waits after the race end for the drivers to complete their last lap. If it is set to 00:00:00 the timekeeping does not use it.

**Variable Length of 10 second countdown:** You can choose the period of time in which the start is executed randomly after the end of the countdown.

**Calculation of best lap times:** You can choose whether the sum of all best times or the average is used.

**Selection of counted best lap times:** You can select if the best lap times have to run in consecutive order or not.

If you have activated “Practice rankinglist will be added with points”, the next window allows to you to specify the point system. Otherwise the wizard led you directly to the qualification.

**Rule Administration - 1:8a**

**Preferences of Practice with Points**

Order of pointsdistribution  
☒ Ascending    ☐ Descending    ☐ Pointscheme

Order of the pointsdistribution: Ascending means, that the first driver has the smallest number of points, descending is the opposite. Further on you can select your own point scheme. This must be entered in the lower part of the window at “Active pointscheme” (of course it must be entered in the inventory data as a point scheme).

If you select the descending point system you can specify, how the points for the first driver will generated. This can be done automatically, manual and according to the number of participants.

In the lower part of the window you can specify, how the points are generated. With the points difference between the first places you can set a bonus for the first places. Further on you can select in this windows how RCM Ultimate resolves tied positions after several heats.

## 10.8.4 Qualification rules

General: To run the race with qualification heats you have to activate “with”. If non is activated, you can not start any qualification heats and you can not arrange qualification heats.

**Follow-up Time after race end:** This is the time the timekeeping systems waits after the race end for the drivers to complete their last lap. If it is set to 00:00:00 the timekeeping does not use it.

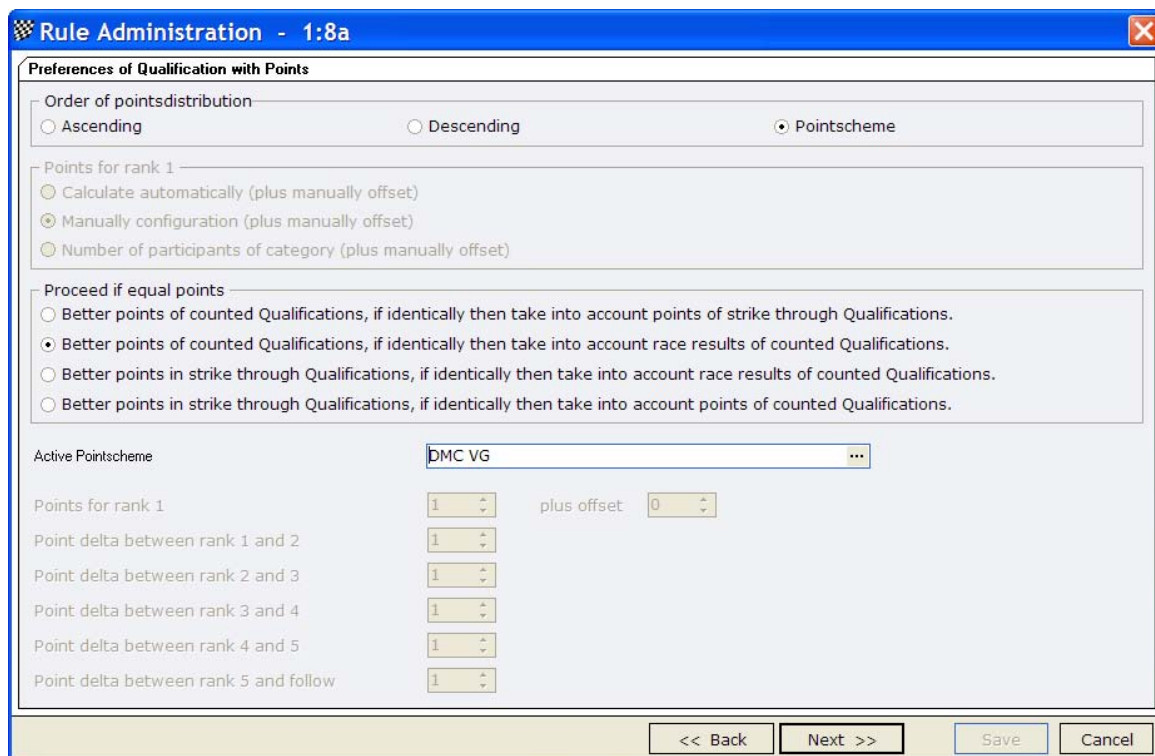

**Variable Length of 10 second countdown:** You can choose the period of time in which the start is executed randomly after the end of the countdown.

**Rule for the redistribution of the starting order:** Here you can determine the rule used for the calculation of the ranking list for the starting order.

**Calculation of best lap times:** You can choose whether the sum of all best times or the average is used.

**Selection of counted best lap times:** You can select if the best lap times have to run in consecutive order or not.

If you have activated “Qualification rankinglist will be added with points”, the next window allows to you to specify the point system. Otherwise the wizard led you directly to the finals.

**Rule Administration - 1:8a**

**Preferences of Qualification with Points**

Order of pointsdistribution: ☐ Ascending ☐ Descending ☒ Pointscheme

Points for rank 1: ☐ Calculate automatically (plus manually offset) ☒ Manually configuration (plus manually offset) ☐ Number of participants of category (plus manually offset)

Proceed if equal points: ☐ Better points of counted Qualifications, if identically then take into account points of strike through Qualifications. ☒ Better points of counted Qualifications, if identically then take into account race results of counted Qualifications. ☐ Better points in strike through Qualifications, if identically then take into account race results of counted Qualifications. ☐ Better points in strike through Qualifications, if identically then take into account points of counted Qualifications.

Active Pointscheme:

Points for rank 1:  plus offset

Point delta between rank 1 and 2:

Point delta between rank 2 and 3:

Point delta between rank 3 and 4:

Point delta between rank 4 and 5:

Point delta between rank 5 and follow:

<< Back Next >> Save Cancel

Order of the pointsdistribution: Ascending means, that the first driver has the smallest number of points, descending is the opposite. Further on you can select your own point scheme. This must be entered in the lower part of the window at “Active pointscheme” (of course it must be entered in the inventory data as a point scheme).

If you select the descending point system you can specify, how the points for the first driver will generated. This can be done automatically, manual and according to the number of participants.

In the lower part of the window you can specify, how the points are generated. With the points difference between the first places you can set a bonus for the first places. Further on you can select in this windows how RCM Ultimate resolves tied positions after several qualification heats.

If you have activated Blockmodus Reseeding before, now a window appears, in which you can define the number of blocks and the size of the blocks.

**Rule Administration - 1:8a**

**Settings for Blockmode Reseeding**

Number of Blocks for Reseeding:

Number of Pilot in 1th Block:

Number of Pilot in 2th Block:

Number of Pilot in 3th Block:

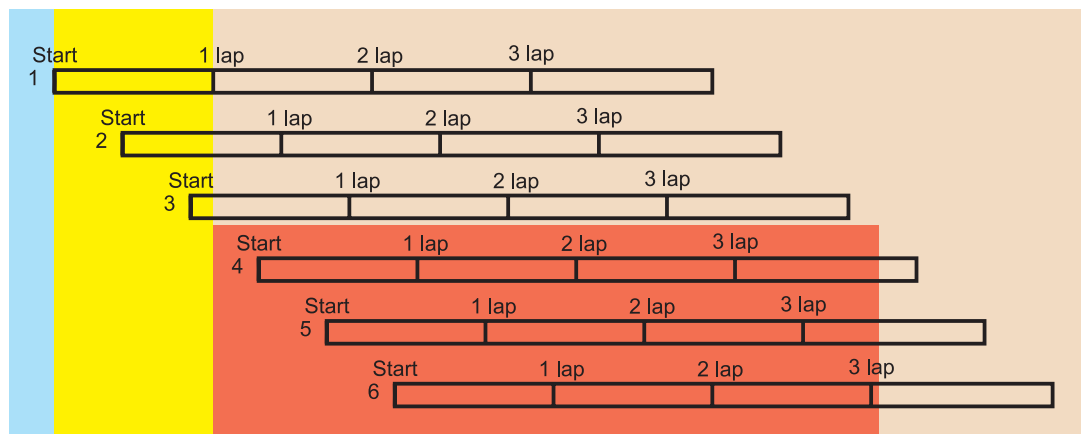

Number of Pilot in 4th Block:

Number of Pilot in Nth Block:

## 10.8.5 Start mode

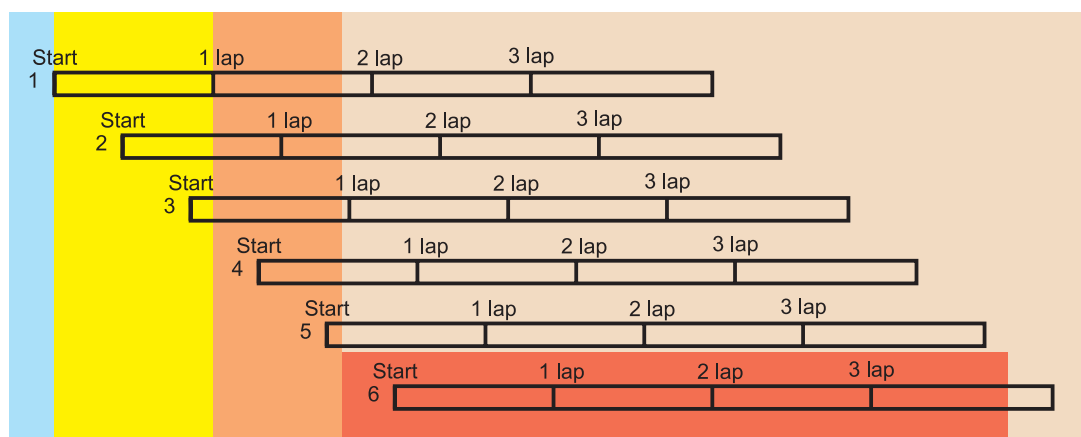

**Singlestart:** The clock of all drivers not having passed the starting line will be started when the first driver has finished his first lap. These drivers can not race for the full racetime.

The following graphic shows the preparation time in light blue. The time the drivers must start is yellow. The clock for all drivers not having passed the starting line will be started when the first driver has finished his first lap. This is shown red in the graphic. The cars number 4, 5 and 6 can not race anymore the full racetime.

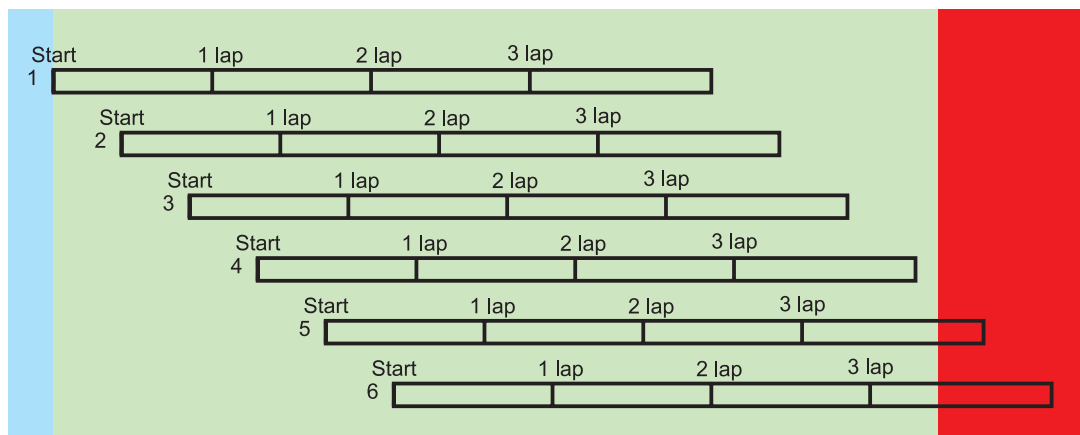

**Singlestart with delay:** Works similar as the single start. After the first driver has finished his first lap, there is an additional delaytime, giving the drivers more time for the start. In between this delaytime, the driver can start as well. The clocks of the drivers not having passed the starting line will be started after the delaytime. Drivers starting after the delaytime can not race the full racetime anymore.

The following graphic shows the preparation time in light blue. The time the first driver needs to finish his first lap is yellow. After that the delaytime begins (orange). Only if the delaytime is gone, the clocks for all cars will be started not having passed the starting line. This is shown red in the graphic. Only car number 6 is starting too late and can not run the full racetime.

**Singlestart with interval:** When the first driver is passing the starting line after the preparation time, the interval time is activated. In between that interval time all drivers can race their race. When the interval time is finished, the race will be finished. An example: The race time is 5 minutes and the interval time is 7 minutes. After the first driver passed the starting line, the other drivers have 2 minutes time to start their race. Do they start after these 2 minutes, they can not run the full racetime of 5 minutes.

The following graphic shows the preparation time in light blue. The start of the first car activates the interval time (light green), in which the drivers have to run their race. If the interval time is finished, the race will be finished. In the graphic car 5 and 6 can not run the full racetime, cause they have not completed their racetime when the interval time was over (red).

Groupstart: The clocks of all drivers start running with the starting signal.

### 10.8.6 Points in heats

Order of the pointsdistribution: Ascending means, that the first driver gets the smallest number of points and the other drivers get more points , descending is the opposite.

If you select the descending point system you can specify, how the points for the first driver will generated. This can be done automatically, manual and according to the number of participants.

In the lower part of the window you can specify, how the points are generated. With the points difference between the first places you can set a bonus for the first places.

Examples:

Ascending: To produce the following rankinglist the settings have to be: Ascending and below the points have to set to 0, 2, 1, 1, 1. This setting results in the following rankinglist:

1. Name 1 15 05:01:15 0  
2. Name 2 15 05:02:25 2  
3. Name 3 15 05:03:35 3  
4. Name 4 15 05:04:45 4  
5. Name 5 15 05:05:55 5  
6. Name 6 14 05:01:65 6  
7. Name 7 14 05:03:75 7  
8. Name 8 14 05:05:85 8  
9. Name 9 14 05:07:95 9 and so on

Descending: To produce the following rankinglist the settings have to be:

Descending and below the points have to set to 35, Offset 0, 1, 1, 1, 1. This setting results in the following rankinglist:

1. Name 1 15 05:01:15 35  
2. Name 2 15 05:02:25 34  
3. Name 3 15 05:03:35 33  
4. Name 4 15 05:05:55 32  
5. Name 5 15 05:05:55 32  
6. Name 6 14 05:01:65 30  
7. Name 7 14 05:03:75 29  
8. Name 8 14 05:05:85 28  
9. Name 9 14 05:07:95 27 and so on

Place 4 and 5 shows, that the points are equal for an equal result.

Procedure in case of a tied position: This procedure is only used, if the points are calculated for more than one round of heats.

Better points of counted Qualifications, if identically than take into account points of strike through Qualifications: First the single point values of the counted rounds are compared. If the drivers have identical point values, the points of the rounds not counted will be compared.

Better points of counted Qualifications, if identically than take into account race results of counted Qualifications: First the single point values of the counted rounds are compared. If the drivers have identical point values, the number of laps/time of the counted rounds will be compared.

Better points in strike through Qualifications, if identically than take into account the race results of counted Qualifications: First the single point values of the not counted rounds are compared. If the drivers have identical point values, the number of laps/time of the counted rounds will be compared.

Better points in strike through Qualifications, if identically than take into account points of counted Qualifications: First the single point values of the not counted rounds are compared. If the drivers have identical point values, the single point values of the counted rounds are compared.

Points for rank 1: This setting is only for the descending order. The number of drivers will be counted and the points will be given according to this number. For example: if you have 37 drivers, 37 is the basis for the first place. To give more points to the better drivers, you can add an Offset to the first place as well as distance to the next placed drivers can be defined.

## 10.8.7 Rules for the finals

The main selection for the finals is the question to run subfinals and mainfinal or only Finals (Heart of America System). Additional you can select subfinal and mainfinal (ABC Mixmode). In this mode you run the subfinals with drivers moving up but after the subfinals you will have more finals for the lower placed drivers. For example the drivers of place 11th to 20th, 31st to 30th run finals too.

**Rule Administration - EFRA TC**

<< Back   Next >>   Save   Cancel

Heats end after: Time: The heats will be finished after a specific time. Times or laps: The heats will be finished after the number of laps or after the race time is over.

Laps: The heats will be finished after a specific number of laps.

Start with Singlestart: The finals will be started with singlestart.

Start with groupstart: The finals will be started with groupstart.

Arrangement of Subfinals: The arrangement can be selected for the normal mode or a special Stockcar-mode.

Final Rankinglist: You can select whether only the drivers arranged in Finals or all drivers from the qualification rankinglist will be ranked.

Separate Rankinglists: You can choose, whether all drivers will be in one rankinglist or if the rankinglists are generated for licensed and not licensed separately. A licensed driver is set in the inventory data/persons, the field licensed must be activated. If this is not activated, the driver is handled as a non licensed driver, independent from inputs in the other fields of the license.

The startorder for the next final run is only active when Final runs are selected.

According to car number: The starting order will always be 1 to 10 independent of the results of any final.

According to actual rankinglist: The final will be shown in the race overview (time keeping) in the order of the ranking list and this will be the start order.

According to last heart ranking: The next final will be shown in the race overview according to the result of the last run of this final. The cars are started in that order.

## 10.8.8 Subfinals and Mainfinal

This system is widely known as Christmas tree and includes one mainfinal and the subfinals in arms (normally two, A and B, but you can select other values).

The screenshot shows the 'Rule Administration' window with the 'Preferences of Subfinals and Finals' tab selected. The window contains various settings for race configuration:

- Maximum drivers per Final Heat:** 10
- Groups:** A (Mainfinals), B (1/2 Subfinals, 1/4 Subfinals, 1/8 - 1/8192 Subfinale, 1/16384 - 1/65536 Subfinale)
- Directly qualified:** 4 (Mainfinals), 7 (Subfinals)
- Heat Number:** 1
- Counted:** 1
- Laps:** 60
- Duration:** 00:45:00 (Mainfinals), 00:30:00 (Subfinals)
- Trainingheat:** Unchecked
- Trainingtime:** 00:10:00
- Follow-up time after race end:** 00:00:30
- Variable length of 10 second countdown:** 0
- Training Mainfinal:** Only direct qualified final pilots (selected), All qualified final pilots
- Optimize last SubFinals:** No Optimizing (selected), Optimizing
- Startorder:** A..Z Subfinals (selected), Z..A Subfinals

Navigation buttons at the bottom: << Back, Next >>, Save, Cancel.

**Maximum driver per final heat:** Number of the drivers in each final, normally the finals will be run with 10 drivers.

**Groups:** Defines how many lines are run (A, B, C etc,) For the normal Christmas tree system select A for the mainfinal and B for the subfinals.

**Directly qualified:** The number of drivers taking part in that final according to the ranking after the qualification.

**Heat number:** The number of heats are run for a final. Normally it is set to 1.

**Counted:** If you run more than one heat per final, you can select how many of the heats are counted.

**Laps:** The number of laps how much will be raced is set (depending on the settings in Finals).

**Duration.** Here you have to specify the race time. The first box is the day. A 24-h-race has to be configured as 1 00:00:00.

**Trainingheat:** If activated, the drivers for that final have the possibility to run a practice round. The result of this practice does not affect the final ranking list.

**Trainingtime:** The duration for the practice round.

**Follow-up Time after race end:** This is the time the timekeeping systems waits after the race end for the drivers to complete their last lap. If it is set to 00:00:00 the timekeeping does not use it.

**Variable Length of 10 second countdown:** You can choose the period of time in which the start is executed randomly after the end of the countdown.

**With Training Mainfinal** you can select whether only the directly qualified drivers or all qualified drivers can race this practice.

**Optimize last subfinals:** If you select Optimizing, the last subfinals will be combined if the number of drivers is less or equal to the Maximum drivers per Final Heat. This saves sometimes a Final. Selecting No Optimizing means, that the subfinals will be run in the number of the selected lines.

Startorder: This will be define the order of the finals. A ... Z Subfinals starts with the A-Subfinal followed by B, C and so on. Z ... A Subfinals starts with the Z-Subfinal (having selected two lines with B under Groups the B-Final will be started first. In the next window you can specify the preferences for the moveup from subfinals. Fix move up: The number of drivers moving up according to the result of the subfinal (place).

	Fix MoveUp	Timed best	
1/2 Subfinals	2	2	Into Mainfinals
1/4 Subfinals	3	0	Into 1/2 Subfinals
1/8 - 1/8192 Subfinals	3	0	Into 1/4 Subfinals
1/16384 - 1/65536 Subfinal	3	0	Into next Subfinals

Move up from Subfinals into Subfinal or Final

- ☒ Normal move up mode with fix move up and timed best
- ☐ Move up depending on sort order of final rankinglist (no timed best)

Ranking option in wet conditions

- ☒ Fix number of move ups per Sub- / Semifinal
- ☐ sorted (Laps and Endtime)

<< Back   Next >>   Save   Cancel

Timed best: Number of drivers moving up to the next upper final by a mixed result of all lines (A, B, C ...) with the best laps and times.

The move up of subfinals: Fix move up means, that the drivers move up in the groups (A, B or C ...), for example the best drivers from the B subfinal move up to the next higher B-subfinal. Move up from rankinglist means, that a rankinglist is made for the drivers moving up and the first will move up to the next higher A-subfinal, the second to the B-subfinal and so on.

Ranking Option in wet condition: Linear means, that the drivers move up according to their position in the subfinal and no timed best result is used. The places for the best timed drivers will be spread out to the subfinals and there are only fixed move ups.

Sorted (laps and times) means that the configuration of best timed move ups are changed to fixed. All first places are compared and the fastest driver will be moved up to the next higher A-final, the second best in the B-Final and so on.

### 10.8.9 Subfinals and Mainfinal (ABC Mixmode)

This window is the same as Subfinal and Mainfinal. It only differs in the handling of selection of groups at the mainfinal. If you select more heats for the mainfinal you run additional finals for the lower placed drivers (after the subfinals have been run). If you enter "C" for example, there will be 3 mainfinals run. This means, that there were additional mainfinals generated for the drivers placed 11th to 20th and 21st to 30th after the subfinals.

	Groups	Directly qualified	Heat Number	Counted	Laps	Duration	Trainingheat
Mainfinals	A	4	1	1	60	0 00:45:00	<input type="checkbox"/>
1/2 Subfinals	B	7	1	1	60	0 00:30:00	<input type="checkbox"/>
1/4 Subfinals	C	7	1	1	60	0 00:20:00	<input type="checkbox"/>
1/8 - 1/16 Subfinals	D	7	1	1	60	0 00:15:00	<input type="checkbox"/>
1/16 - 1/32 Subfinals	E	7	1	1	60	0 00:15:00	<input type="checkbox"/>
Trainingtime		00:10:00					
Follow-up time after race end		00:00:30					
Variable length of 10 second count down		0					
Training Mainfinal		<input checked="" type="radio"/> Only direct qualified final pilots <input type="radio"/> All qualified final pilots					
Optimize last SubFinals		<input checked="" type="radio"/> No Optimizing <input type="radio"/> Optimizing					
Startorder		<input checked="" type="radio"/> A..Z Subfinals <input type="radio"/> Z..A Subfinals					

<< Back    Next >>    Save    Cancel

## 10.8.10 Finals

If you select only final runs, other inputs are necessary.

**Rule Administration**

**Preferences for finals**

Maximum drivers per final: 10

A until Z Final: Number 3, Counted 2, Laps 60, Duration 00:05:00, Trainingheat ☐

--- until Z final: Number 1, Counted 1, Laps 60, Duration 00:20:00, Trainingheat ☐

☒ Separate number of drivers

Points: ☐ None, ☒ Ascending, ☐ Descending, ☐ Pointscheme

Trainingtime: 00:10:00

Follow-up time after race end: 00:00:00

Variable length of 10 second countdown: 0

Calculation mode for the Final Rankinglist: ☒ Normal Mode, ☐ Stockcar Mode

Proceed if equal points: ☐ Better points of counted Finals, if identically then take into account points of strike through Finals. ☒ Better points of counted Finals, if identically then take into account race results of counted Finals. ☐ Better points in strike through Finals, if identically then take into account positions of Qualificationrankinglist. ☐ Better points in strike through Finals, if identically then take into account best race result of strike through Finals.

Final Ranking if no points have been selected: ☒ Per final heat, ☐ Independent of final heats

<< Back Next >> Save Cancel

Maximum driver per final heat: You can set the number of the drivers of the finals. Normally the finals will be run with 10 drivers. The program automatically generates the number of finals needed according to this number. The finals are named in alphabetically order (A to Z).

In this window you can divide the finals in two groups and set the number of final heats, how many rounds are counted and the duration of the finals separate. For example if you specify in the upper line "A until A Finals", a number of 3, counted 2, you run the A-Final 3 times and you can set for the B- to Z-Finals different values (Number = 1).

Number: Defines how many rounds of finals will be run

Counted: If the finals are run more than one time, you can select, how many results will be counted for the final ranking list.

Duration: The race time for each final.

Laps: The number of laps how much will be raced is set (depending on the settings in Finals).

Practiceheat: If a practice is run for the finals you have to activate this option and to enter the racetime for the practice below.

The number of drivers can be set for each group of finals. If you activate "separate numbers of drivers" you can enter the number for this group of finals in the input field left hand.

The finals can be scored with a point system. If you select "none" laps and time will be counted. Selecting ascending means, that the first place gets one point, the second 2 points and so on. Descending is the opposite, the first place gets 10 points (if you have 10 drivers in the finals), the second 9 points and so on. If you use point system, you have to choose the points system used in the line below.

Follow-up Time after race end: This is the time the timekeeping systems waits after the race end for the drivers to complete their last lap. If it is set to 00:00:00 the

timekeeping does not use it.

Variable Length of 10 second countdown: You can choose the period of time in which the start is executed randomly after the end of the countdown.

Calculation mode for final ranking list: Here you can choose whether the normal mode or a special mode according to the international rules for stockcars is used.

Proceed if equal points: This is the procedure in case of a tied position. This procedure is only used, if the points are calculated for more than one round of heats.

Better points of counted Finals, if identically than take into account points of strike through Finals: First the single point values of the counted rounds are compared. If the drivers have identical point values, the points of the rounds not counted will be compared.

Better points of counted Finals, if identically than take into account race results of counted Finals: First the single point values of the counted rounds are compared. If the drivers have identical point values, the number of laps/time of the counted rounds will be compared.

Better points in strike through Finals, if identically than take into account positions of Qualification rankinglist: First the single point values of the not counted rounds are compared. If the drivers have identical point values, the tie will be decided by the ranking of the Qualification.

Selecting no point system, you can specify if the final ranking list is determined per final heat or independent of the finals. In the last case a driver of the B-Final with better laps and time than a driver from the A-Final will be placed in front of the driver of the A-final in the final result.

## 10.8.11 Preferences for Championship point calculation

Attendee points within Qualification; Without: no points will be given. With per Qualification round: Independent from the result, points will be given for the attendance in each heat. With per Qualification Rank: A driver gets points if he is present in the qualification ranking list.

Points for Qualification Ranking: The Qualification ranking list is completed with

points according to the defined point scheme.

Attendee Points in Subfinals and Finals: Without: no points will be given. With per final run: Independent from the result, points will be given for the attendance in each final. With per Final: A driver gets points if he is present in the final ranking list.

Points for Final Ranking: Without: no points will be given. With: the final ranking list is completed with points according to the defined point scheme.

Points for Final Ranking but depends on number of drivers: Yes: According to the number of drivers in the final ranking list you can select different pointschemes.

The picture shows a lot of different settings. Normally points will be only given for the final ranking list..

Clicking on Next opens a windows to define the points for the qualification.

Attendee points data entry: You can specify the points for scoring just the presence of a driver (as specified in the previous window .

Selection of Qualification of pointtable: You have to select the point scheme for the Qualification ranking list.

The next window let you define the points for the finals.

Selection of attendee point: Number of points valid for all drivers attending a final.

Then you have to select the point scheme for the final ranking list. If there is no point scheme in the inventory data you have to enter one before.

If you have selected, that the point scheme depends on the number of drivers, you can enter two more point schemes with the limits which determine the use of the specified pointscheme.

### 10.8.12 Finalize the rule configuration

You have to save your work on the last window of the rule configuration. If you click on cancel all of your work is lost. After you have saved your selections, the wizard leads you back to the rule administration.

Certain changes in the rules require, that an event must be newly loaded. If this is the case, you get a reminding message after saving you changes. Please close the event in the file menu and reopen it in that case.

## 10.9 Points

Several pointschemes used by the championship editor can be created. With this menu selection you can create, edit, copy and delete a pointscheme.

## 10.9.1 Add new pointscheme

Selecting Add New Pointscheme you have to enter some basic data in the following window. After that the point scheme will be created automatically but can be easily edited.

The 'Add new Pointscheme' window contains the following fields and controls:

- Pointscheme:** A text input field.
- Description:** A larger text input area.
- Number of Points:** A spinner control set to 0.
- Points for 1. Place:** A spinner control set to 0.
- Difference between 2 Points:** A spinner control set to 1.
- Minimale Punkte:** A spinner control set to 0.
- Navigation:** '<< Back' and 'Next >>' buttons.
- Close:** A 'Close' button.

First of all you have to give it a name. The description is optional. Now you have to enter the number of points (number of point definitions), the points for the first place, the difference between two point definitions and the minimal points. Clicking on next opens a new windows for editing the point definitions. For championships normally a descending point system is used. If you want to add now a single point definition, just click on the edit button on the right side of the lower line. If you want to change a point definition, click in the table at the point definition and you can edit it.

Please note, that you have to save your work before closing this windows.

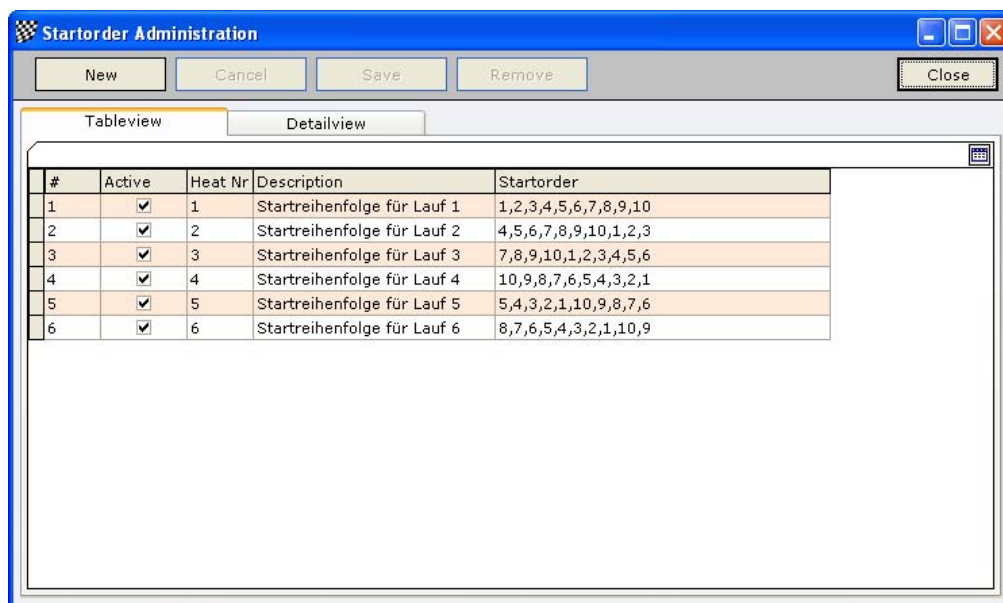

The 'Edit Pointscheme' window contains the following fields and controls:

- Pointscheme:** A text input field containing 'DMC VG'.
- Description:** A text input area containing 'DMC Verbrebber Gkattbahn 1:8 und 1:10'.
- Pointdefinitions:** A table with 4 columns: #, Place, Δ, and Points. It contains 13 rows of data.
- Navigation:** '<< Back', 'Next >>', 'Save', and 'Cancel' buttons.

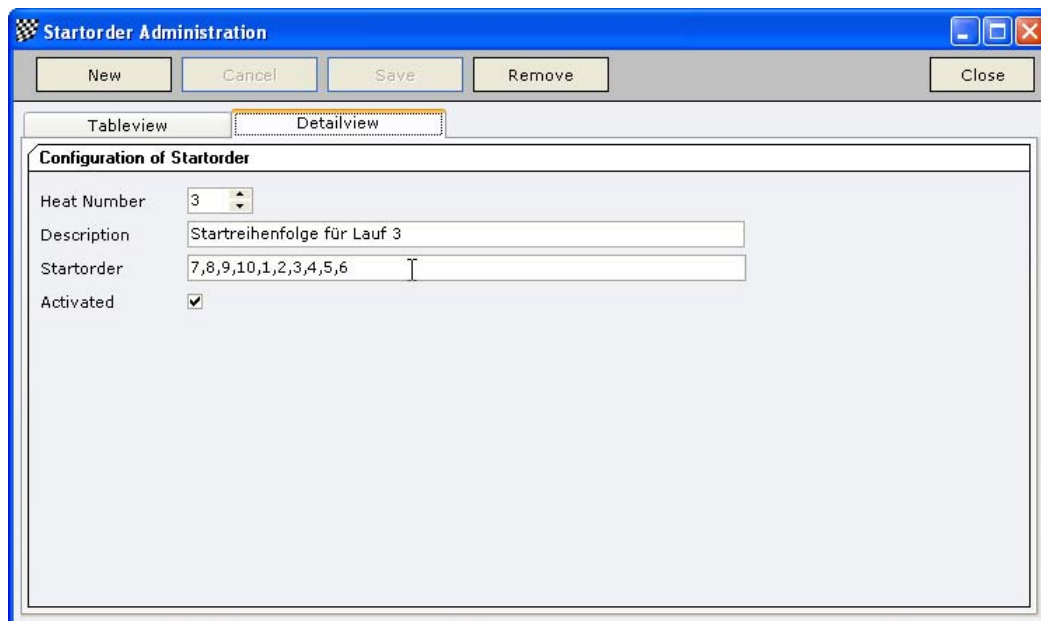

#	Place	Δ	Points
1	1		200
2	2		190
3	3		181
4	4		173
5	5		166
6	6		160
7	7		155
8	8		151
9	9		147
10	10		143
11	11		133
12	12		124
13	13		116

## 10.10 Startorder

Here you can define a arbitrary startorder for the practice and qualification heats. This order can be selected in the rule definition. By default you find one startorder used by the EFRA-rules.

Using this function you will see a table with the data records for 6 rounds. Marking one of these records you can edit it in the detailview tab.

Heat Number: The number of the round this startorder is used.

Description: Name of the data record.

Startorder: Sequence of the car numbers. Please note, that the numbers must be separated by commas.

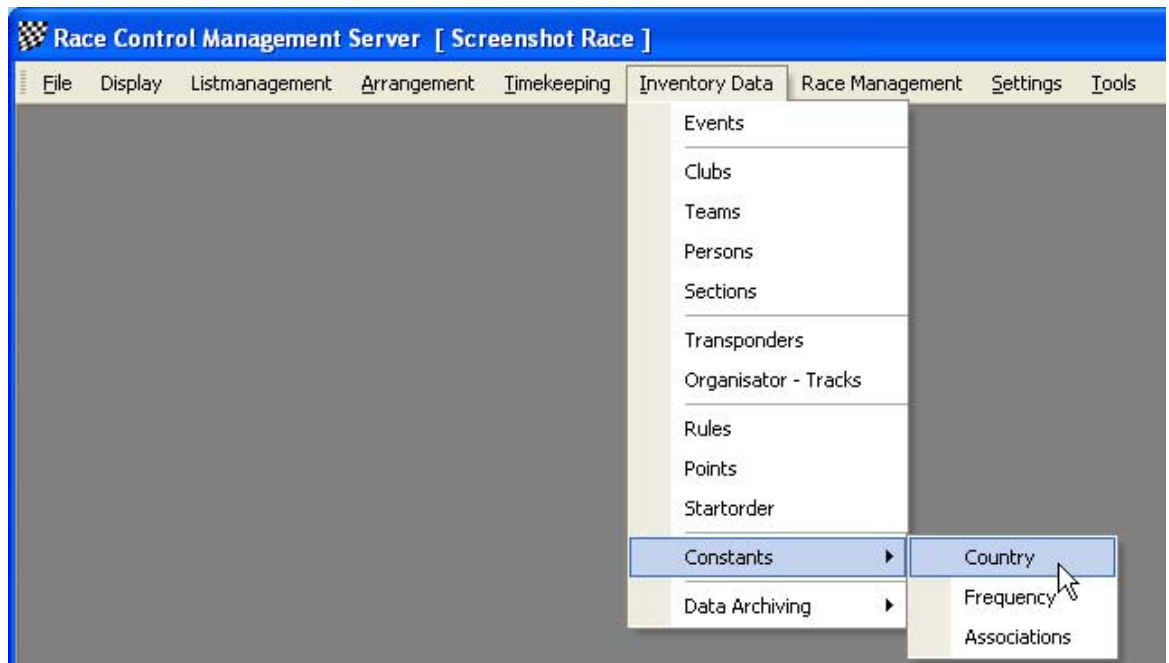

Activated: This data record is active meaning it will be used by RCM Ultimate.

If you make changes your work must be saved before closing the dateilview tab.

Using the New-Button you can add new records for another rounds. Clicking on the remove button will delete the record.

## 10.11 Constants

There exist some international regulations and ISO standards which are used world wide. RCM Ultimate uses the ISO standards for country codes to sort the reports. Further on RCM Ultimate uses the international standard frequencies, but these have to respect country specific regulations. Please check the frequencies allowed in your country and block the illegal frequencies.

### 10.11.1 Countries

The table shows all ISO codes of the countries. The entries in the personal administration must correspond to this table and can use one of the codes in the columns Code 1, Code 2 or Code 3.

#	Country	ISO Code 1	ISO Code 2	ISO Code 3
1	Albania		AL	ALB
2	Algeria		DZ	DZA
3	American Samoa		AS	ASM
4	Andorra		AD	AND
5	Angola		AO	AGO
6	Anguilla		AI	AIA
7	Antarctica		AQ	ATA
8	Antigua and Barbuda		AG	ATG
9	Argentina		AR	ARG
10	Armenia		AM	ARM
11	Aruba		AW	ABW
12	Australia		AU	AUS
13	Austria		AT	AUT
14	Azerbaijan		AZ	AZE
15	Bahamas		BS	BHS
16	Bahrain		BH	BHR
17	Bangladesh		BD	BGD
18	Barbados		BB	BRB
19	Belarus		BY	BLR
20	Belgium		BE	BEL
21	Belize		BZ	BLZ
22	Benin		BJ	BEN
23	Bermuda		BM	BMU

Using the detailview tab you can edit a data record. Before using the detailview tab you have to select the record by left clicking on it.

The screenshot shows the 'Country Administration' window with the 'Detailview' tab selected. The window has buttons for 'Add Country', 'Cancel', 'Save', 'Remove', and 'Close'. The 'Countrydata' section contains the following fields:

Countr	American Samoa
ISO Code 1	[1-Digit]
ISO Code 2	AS [2-Digits]
ISO Code 3	ASM [3-Digits]

### 10.11.2 Frequency

All international used frequencies are already entered in this table. For all frequencies the upper and lower image frequency is calculated to avoid interference on the race track. For all official frequencies the corresponding channel number is included.

The screenshot shows the 'Frequency Administration' window with the 'Tableview' tab selected. The window has buttons for 'Add Frequency', 'Cancel', 'Save', 'Remove', and 'Close'. The table below lists frequency data:

#	Channel	Frequency	Mirrorfrequency [Upper]	Mirrorfrequency [Lower]	Frequency Locks
1	1	26.965	27.420	26.510	No Frequency Lock
2	2	26.975	27.430	26.520	No Frequency Lock
3	3	26.985	27.440	26.530	No Frequency Lock
4	4	26.995	27.450	26.540	No Frequency Lock
5	5	27.005	27.460	26.550	No Frequency Lock
6	6	27.015	27.470	26.560	1 Frequency Lock
7	7	27.025	27.480	26.570	No Frequency Lock
8	8	27.035	27.490	26.580	No Frequency Lock
9	9	27.045	27.500	26.590	No Frequency Lock
10	10	27.055	27.510	26.600	No Frequency Lock
11	11	27.065	27.520	26.610	No Frequency Lock
12	12	27.075	27.530	26.620	No Frequency Lock
13	13	27.085	27.540	26.630	No Frequency Lock
14	14	27.095	27.550	26.640	No Frequency Lock
15	15	27.105	27.560	26.650	No Frequency Lock
16	16	27.115	27.570	26.660	No Frequency Lock
17	17	27.125	27.580	26.670	No Frequency Lock
18	18	27.135	27.590	26.680	No Frequency Lock
19	19	27.145	27.600	26.690	No Frequency Lock
20	20	27.155	27.610	26.700	No Frequency Lock
21	21	27.165	27.620	26.710	No Frequency Lock
22	22	27.175	27.630	26.720	No Frequency Lock
23	23	27.185	27.640	26.730	No Frequency Lock

With the New button and the Remove button you can add new frequencies or delete existing ones.

Using the detailview tab you can lock illegal frequencies. This should be done, if your country does not allow special frequencies or if known frequencies are used nearby the track.

**Frequency Administration**

Add Frequency Cancel Save Remove Close

Tableview Detailview

**Frequencydata**

Channel 6

Frequency [MHz] 27.035

Upper Mirrorfrequency [MHz] 27.490

Lower Mirrorfrequency [MHz] 26.580

**Track Frequency Locks**

#	Host	Track
---	------	-------

New Delete

To lock a frequency you select it in the table and use the detailview tab. With the note button on the right side of the windows you can select the organiser and the tracks where this frequency is forbidden.

A locked frequency will result at the heat arrangement in an error message that the driver is not allowed to use this frequency.

### 10.11.3 Associations

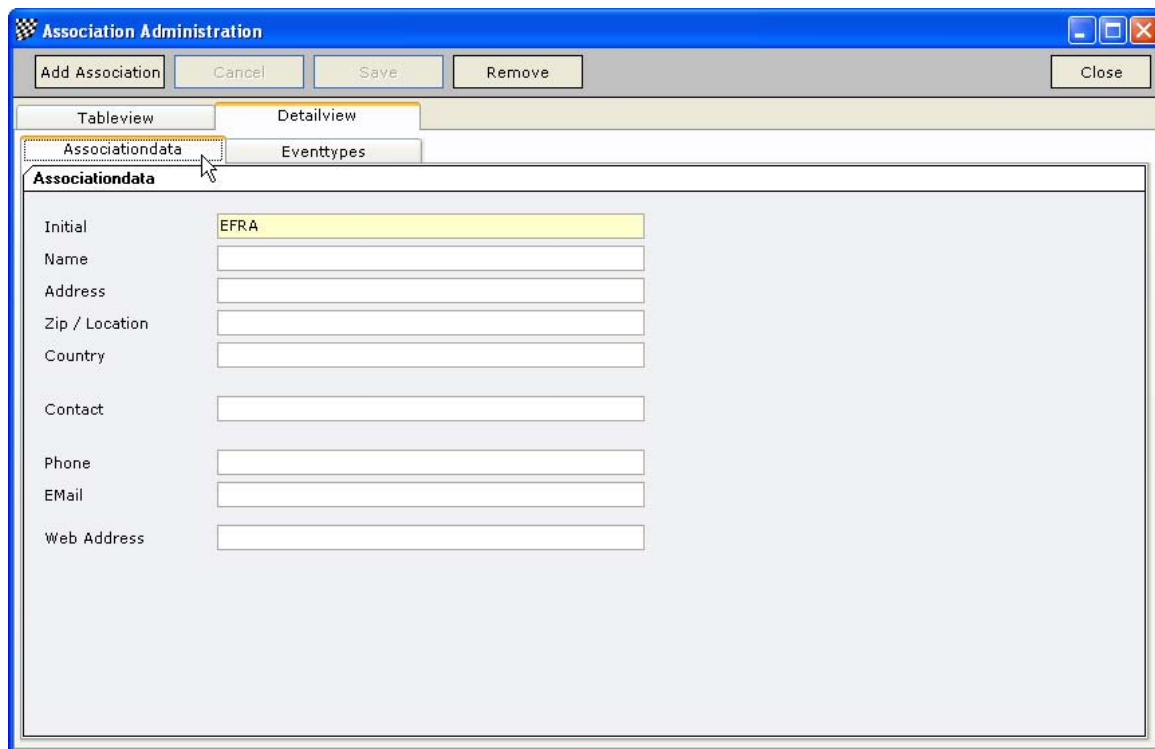

A driver can be assigned to an association. This is only for information and therefore the entry is optional. This entry should be respected on national level and not be used for club level.

**Association Administration**

☒ Tableview
 ☐ Detailview

#	Initial	Name	Address	Zip / Location	Count
5	DMC				Deuts
1	EFRA				
4	FAMAR				
2	FEMCA				
3	ROAR				
6	SRCCA				Schw

The associations already entered are displayed in a table view. Using the Add Association button you can add a new record. With the detailview tab you can see and edit the details of an association.

The screenshot shows the 'Association Administration' window with the 'Detailview' tab selected. The 'Associationdata' sub-tab is active, displaying a form with the following fields:

Initial	EFRA
Name	
Address	
Zip / Location	
Country	
Contact	
Phone	
E-Mail	
Web Address	

Using the eventtypes tab you can enter events (for example national championships) of this association. Using the New-button on the right side of the table of the eventtypes you can add a new eventtype. Edit allows you to change the description and with remove you delete an eventtype.

The screenshot shows the 'Association Administration' window with the 'Eventtypes' tab selected. The table displays the following data:

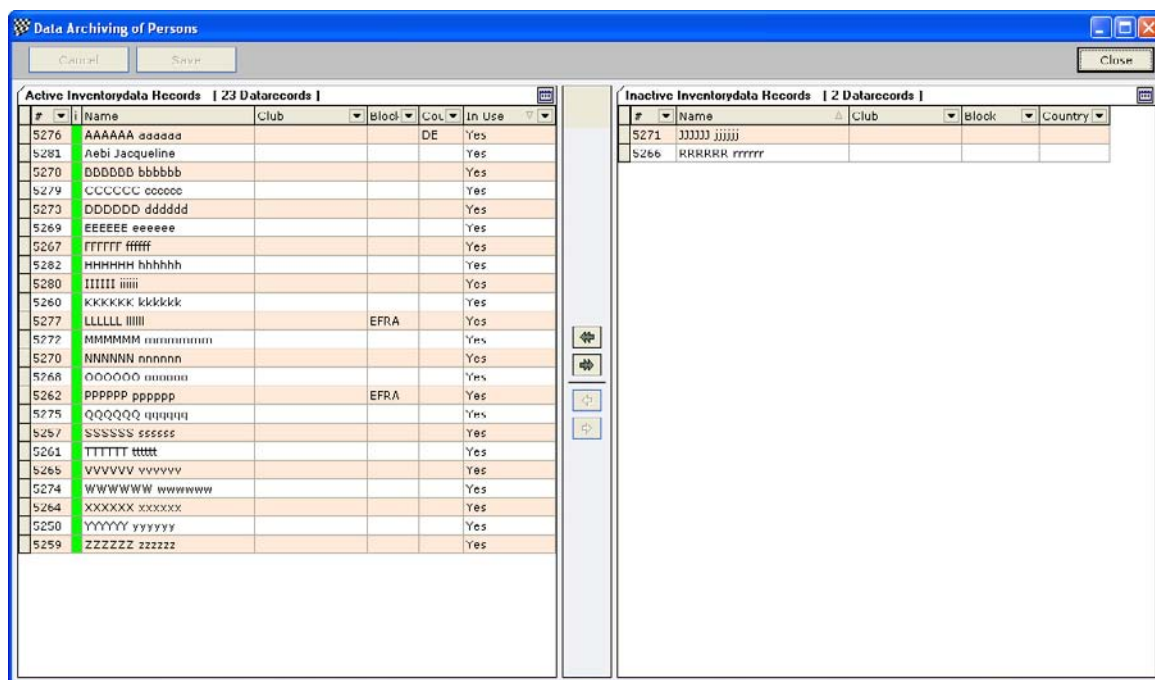

#	Eventtype
2	National Race
1	International Race
3	Club Race

On the right side of the table, there are three buttons: 'New', 'Edit', and 'Remove'.

## 10.12 Data archiving

### 10.12.1 Persons

Usually the persons in the inventory data will be created by an import of data placed by your national federation for disposal. But not all clubs need all the data. Therefore RCM Ultimate provides a function to archive the personal data. Needed single drivers can be reactivated from the archive. Importing the federation data the drivers will be entered to the archive. Do active drivers exist, the data will be synchronised. If a driver is no more in the federation data, it is assumed that the driver does not have a licence anymore. This driver is automatically set to inactive.

When opening Data Archiving/Persons you see in the left column all activated drivers and in the right column the inactive (archived) drivers. A driver can be set active by left clicking on his name in the right column and clicking on the left arrow button in the middle between the both columns. To set a driver to inactive left click on his name in the left column and use the right arrow button. Using a filter and/or a multiple selection (press the Ctrl or Shift key when you click on the drivers name) you can set several drivers to active or inactive simultaneous.

The green marked drivers in the left column are participants of the event loaded. These can not be set to inactive.

Please note, that you have to use the Save button before closing the window.

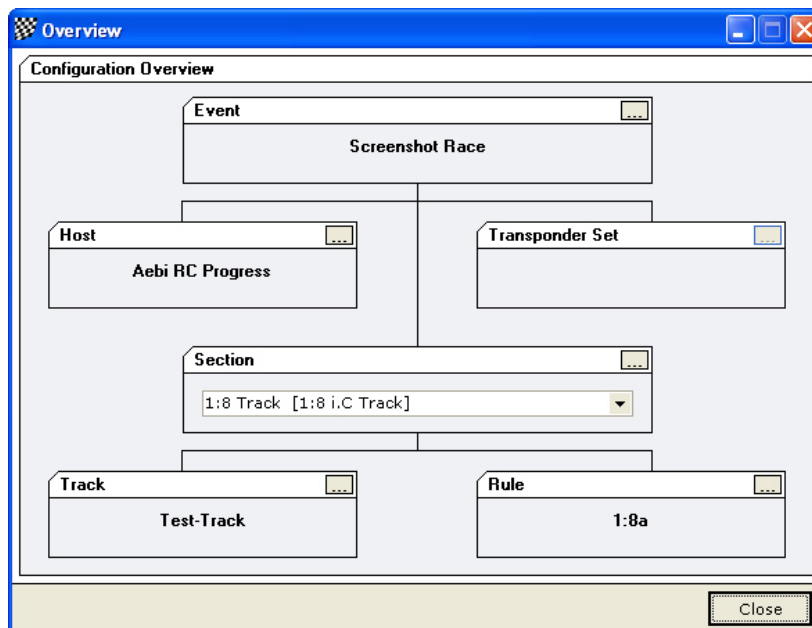

## 11 Race Management

The menu Race Management offers some powerful additions like skill adjustment, a championship editor, creating a time schedule, race analysis, the race overview and the definition of the voice announcements to you.

### 11.1 Overview

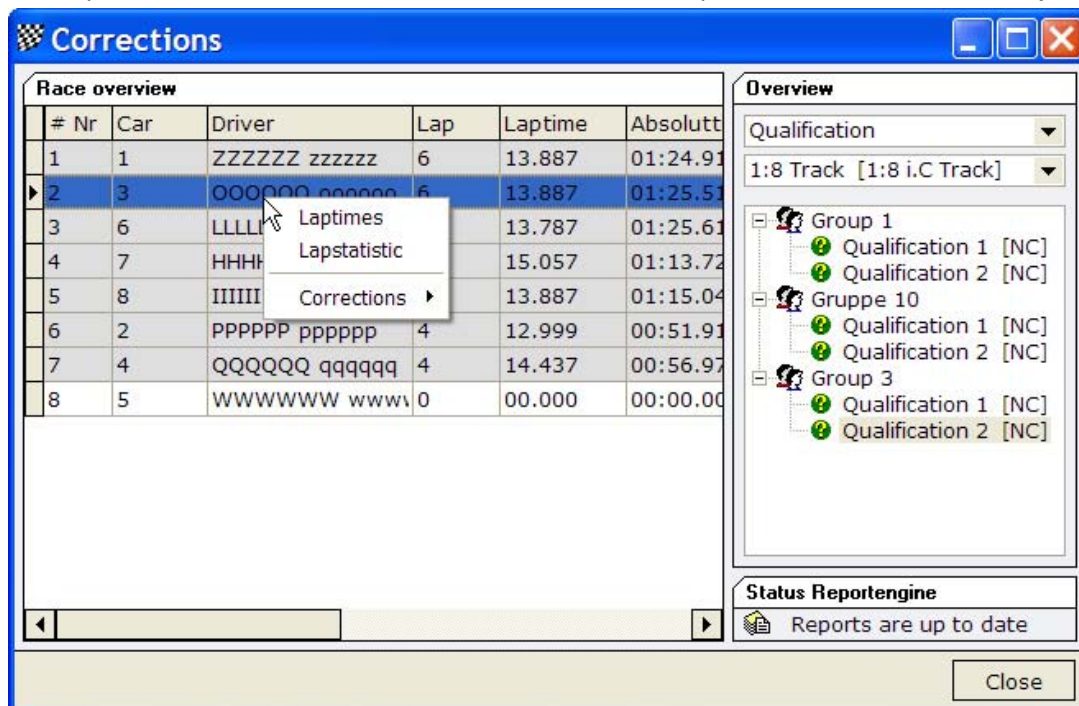

With the race overview you can check the composition of the event. This is an graphical overview. You can click on the elements to go to the detailview of the selection directly. This can speed up the handling of the program.

## 11.2 Corrections

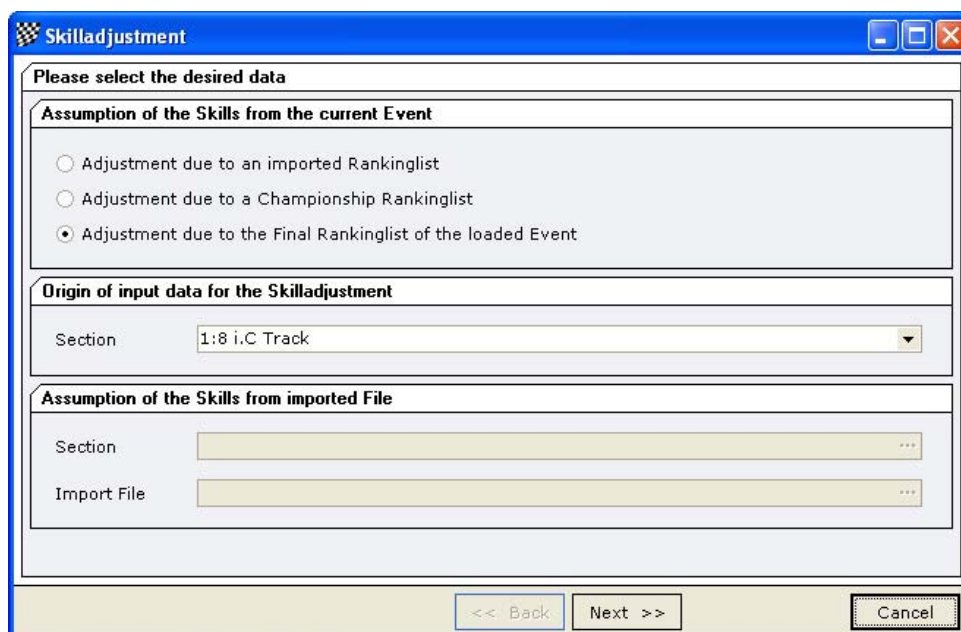

Here you can correct the results of all heats already run even if a race is in progress.

In the right column of the window you select on top if you want correct a practice, a qualification heat or a final. Below of that you select the section. Like in the race overview, you can now select the heat you want and in the right column the result is displayed. Clicking right on a drivers name, a submenu is displayed and you can select the function you want to perform. The functions are the same as described in timekeeping/corrections in this manual.

## 11.3 Skilladjustment

The arrangement of the heats is usually based on the skill of the drivers. During a season the skills can change.

The function Skilladjustment allows you to adjust the skill of the drivers continuously. The skill is calculated per section according to the championship ranking list.

Another option to adjust the skill of the drivers is the import of a ranking list file. This procedure should be used if you are not familiar with the performance of the drivers. In that case you have to enter the section and the import file.

The next window shows you all drivers in question together with the current skill values and the new calculated suggestion. You can now accept or reject this suggestion.

You can also enter the skill levels in the personal inventory data.

## 11.4 Championship Editor

Selecting the Championship Editor in the Race Management menu enables you to create a championship ranking list.

Select Add new Championship if you create the championship ranking list the first time. To add a event to an existing championship ranking list, select Edit championship.

**Championship Administration**

**Add new Championship**

**Data of Championship Rankinglist**

Name: Test

Comment:

**Settings of Championship Rankinglist**

Year: 2011

Number of Events: 6

Locked Events: 2

Section: TC\_EFRA [EFRA TC]

**Settings for Championship Rankinglist calculation**

Placement: ☐ Pilots with equal points awarded the same Championship ranking position

Tie positioning: ☒ Better points in the counted results, if identically than compare points of striked through results  
☐ Compare total of striked through results, if identically than better points in striked through results

**Licence settings of Championship Rankinglist**

Licence required: ☐

Level: -

<< Back Next >> Save Cancel

To create a new championship you have to enter the name and the year first. The Description is optional and only for information. Further on the following inputs are needed:

**Number of Events:** Enter the number of events which are run for the championship. Please note, that all events must run the same section.

**Locked events:** The number of events which are not counted. If the championship consists of 6 events and the 4 best will be counted, you have to enter the value of 2.

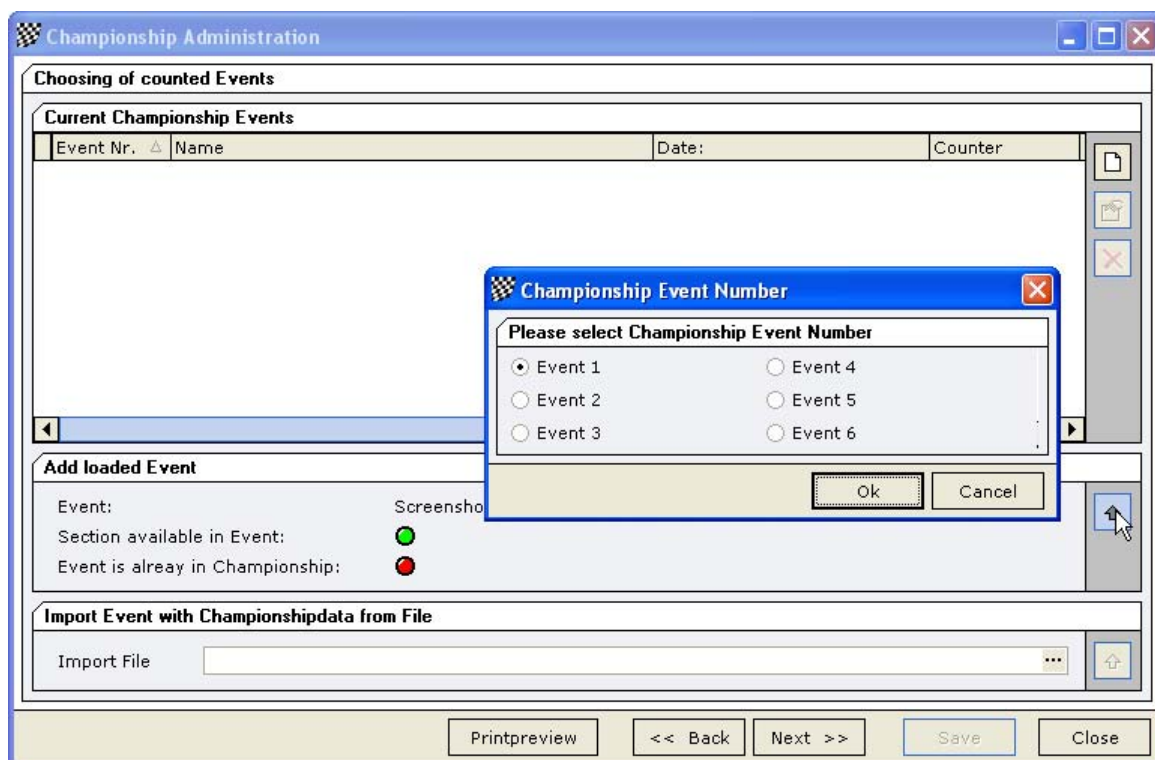

**Section:** The section for the championship has to be entered here.

**Placement tie positioning:** Here you can define the procedure, how tied positions are handled.

**Level:** If you select the championship into different skill levels for the drivers you have to enter the skill level here.

If you activate „licence required“ only drivers will be added to the championship lists, where the option “licence” is in the inventory data is activated.

Click on the Save button and then Next to go to the next window. In the upper part of the window, all events already entered to this championship are listed. Creating a new championship this list is empty.

**Add loaded Event:** A green circle at Section available in event says, that the event can be added to the championship. A red circle means, that the event is loaded, but the selected section is not available. Further on it possible, that the loaded event does not has a eventrankinglist with the points for the championship. In this case please check that a pointscheme is defined in the rule. If you have to add a pointscheme afterwards, you have to reload the event and you have to create a new final rankinglist.

**Event is already in Championship:** Red circle means, that the event is not yet processed to the championship and you can add it. A green circle means, that the event is already calculated in the Championship.

To add the event to the championship you have to click on the up arrow button on the right side. The event will be entered to the list after you have addressed this event to the number of the sequence.

An event can be removed from the championship easily by left clicking on the event and clicking on the cross button on the right side.

Clicking on the Printpreview button shows you a summary of all Races entered in this championship.

If the event is added to the championship, the colour of the circle changes to green. Clicking on next leads you to the next window.

This windows lists the rankinglist of the added event with all points in detail.

Clicking in Next will now add the event to the championship and the new ranking list of the championship is calculated. Clicking on the printpreview button shows you the list as it can be printed from this window.

**Championship Administration**

**Championship Rankinglist [Point per Heat and Total]**

Pos	Name	Points	Locks	Events	Nr. 1	Nr. 2	Nr. 3
1	MMMMMM mmmmmm	201	0	1 [0]	201 / 0	- / -	- / -
2	ZZZZZZ zzzzzz	191	0	1 [0]	191 / 0	- / -	- / -
3	QQQQQQ qqqqqq	183	0	1 [0]	183 / 0	- / -	- / -
4	OOOOOO oooooo	174	0	1 [0]	174 / 0	- / -	- / -
5	XXXXXX xxxxxx	167	0	1 [0]	167 / 0	- / -	- / -
6	LLLLLL llllll	161	0	1 [0]	161 / 0	- / -	- / -
7	WWWWWW wwwwww	156	0	1 [0]	156 / 0	- / -	- / -
8	HHHHHH hhhhhh	152	0	1 [0]	152 / 0	- / -	- / -
9	IIIIII iiiiii	148	0	1 [0]	148 / 0	- / -	- / -
10	PPPPPP pppppp	145	0	1 [0]	145 / 0	- / -	- / -
11	KKKKKK kkkkkk	134	0	1 [0]	134 / 0	- / -	- / -
12	YYYYYY yyyyyy	125	0	1 [0]	125 / 0	- / -	- / -
13	VVVVVV vvvvvv	117	0	1 [0]	117 / 0	- / -	- / -

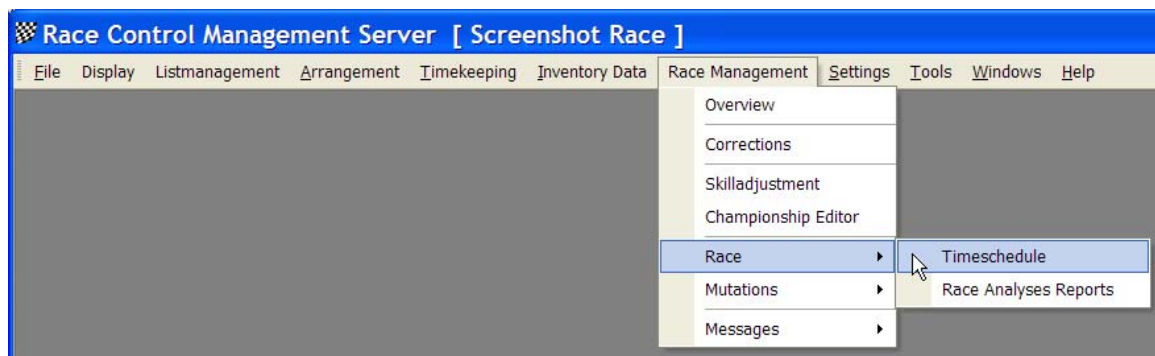

Buttons: Printpreview, << Back, Next >>, Save, Close

To add another event to this championship, close this window and load the next event. Then repeat the process to add this event to the championship. To get a complete rankinglist of the championship you have to repeat this process for all events of the championship.

Remark: If an event is not counted, please check the number of not counted events.

## 11.5 Race

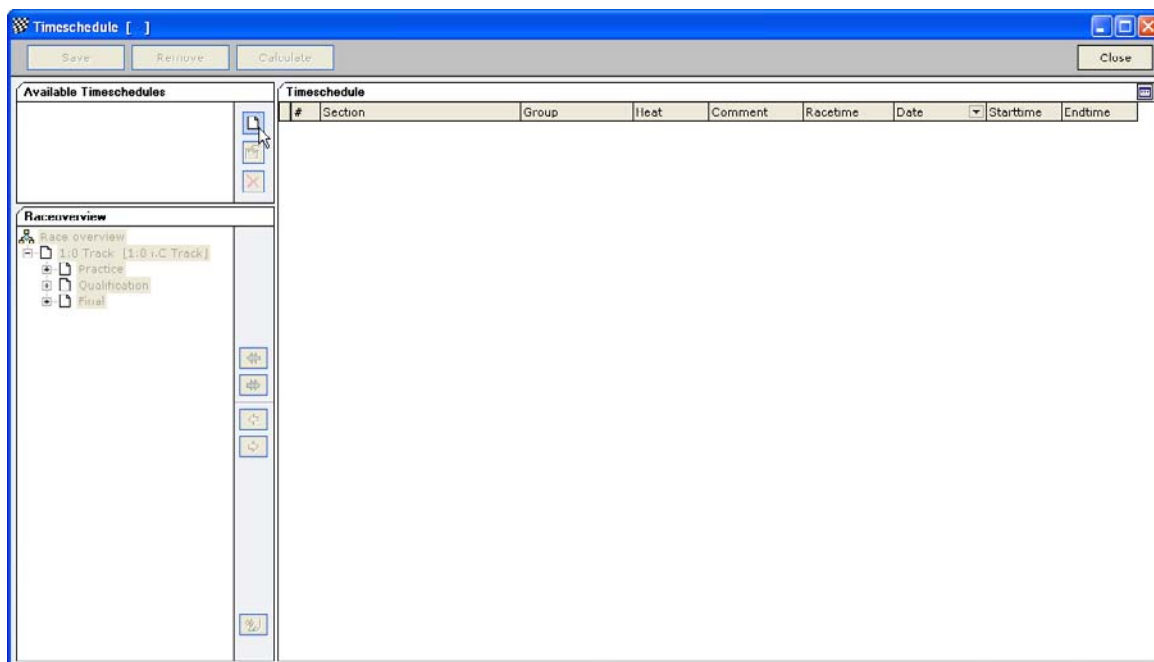

Here you find additional functions for running an event: an editor for the time schedule as well as special race analysis reports.

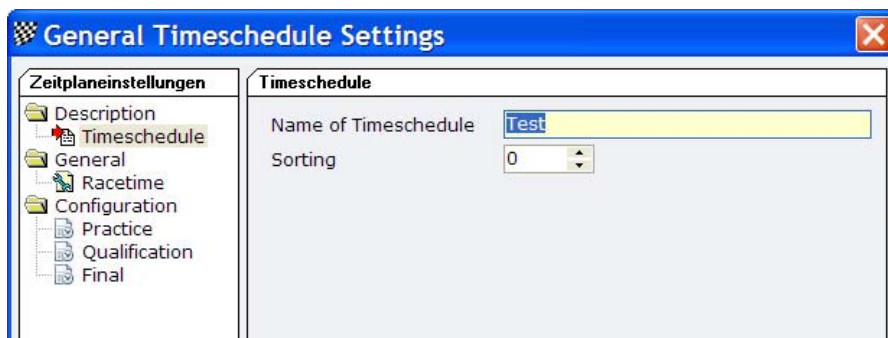

## 11.5.1 Time schedule

If an event is loaded you can create a detailed time schedule. You can create one or more time schedules for this event. Especially for bigger events it make sense to create a time schedule for each day.

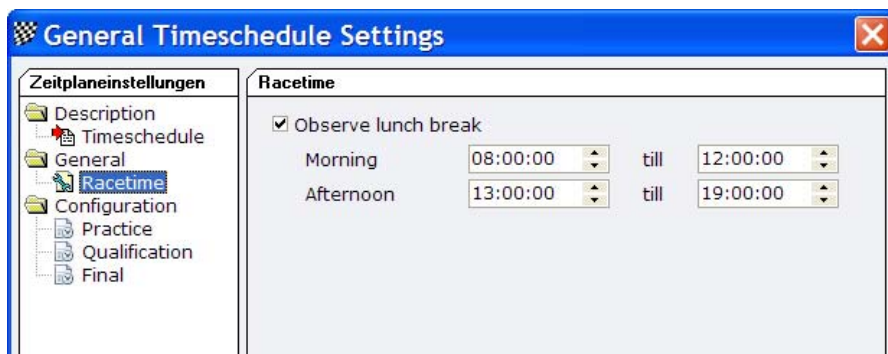

A window opens in which the existing time schedules are listed in the upper field of the left column. On the right edge you find buttons to create a new time schedule, to edit the basic inputs for the time schedule and to delete a time schedule. In the lower field of the left column all heats for all sections are shown.

Create a new time schedule: First you have to enter the name for the time schedule. After that you have to enter the sorting. The sorting determines the order of the time schedules in the lists of RCM Ultimate.

At General Timeschedule Settings you have to enter the race times of the day.

In Configuration you have to enter details for practice, qualification and the finals.

The dialog box 'General Timeschedule Settings' is shown with the 'Qualification' tab selected. The left sidebar shows a tree view with 'Qualification' highlighted. The main area contains the following settings:

Setting	Value
Start of Qualifications	14.07.2008
Calculation Tolerance	00:05:00
Delay between 2 Groups	00:03:00
Minimal time interval Qualification --> Final	00:00:00
<input checked="" type="checkbox"/> Observe time interval between 2 heats	
Minimal time interval	01:00:00

Buttons: Ok, Cancel

The starting day of the heats, the calculation tolerance, the delay between two groups. Additional you can specify the time interval to the next unity (from practice to qualification and from qualification to finals) Further on you can specify if a time interval between two rounds should be observed.

In the finals you can specify the time interval between the 1/2 Finals and the Final.

The dialog box 'General Timeschedule Settings' is shown with the 'Final' tab selected. The left sidebar shows a tree view with 'Final' highlighted. The main area contains the following settings:

Setting	Value
Start of Finals	15.07.2008
Calculation Tolerance	00:05:00
Time interval between 2 Finals / SubFinals	00:03:00
Time interval between 1/2 SubFinal and MainFinal	00:00:00
<input checked="" type="checkbox"/> Observe time interval between 2 Finals	
Minimal time interval	01:00:00

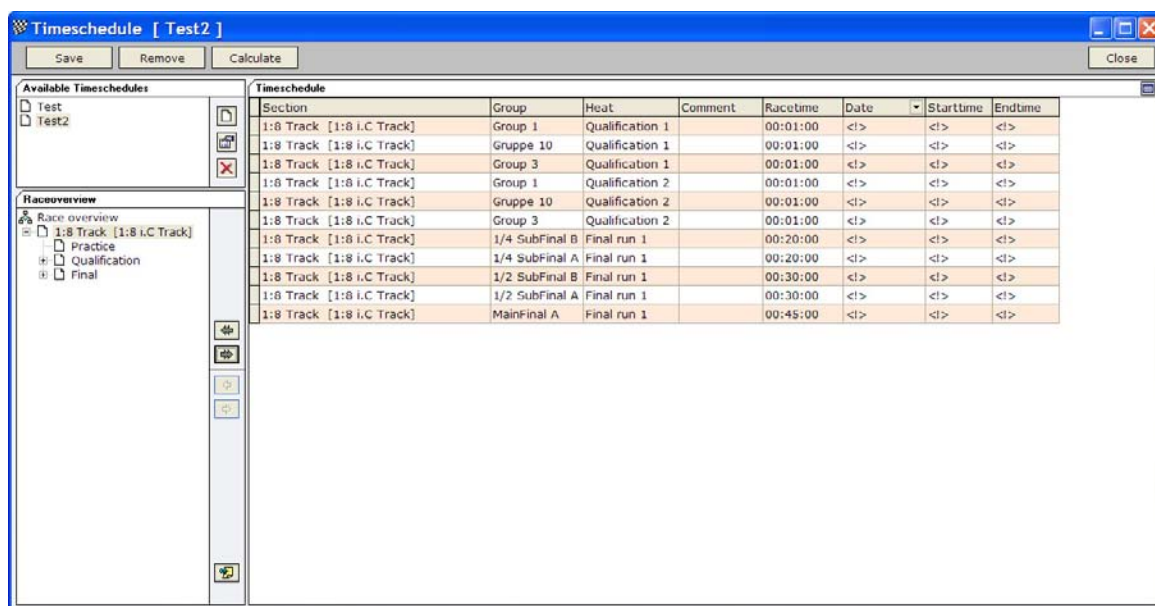

Buttons: Ok, Cancel

You have to save the time schedule before continuing. Further on you have to click on Create before you can print it. After this, the time schedule is taken over by the program.

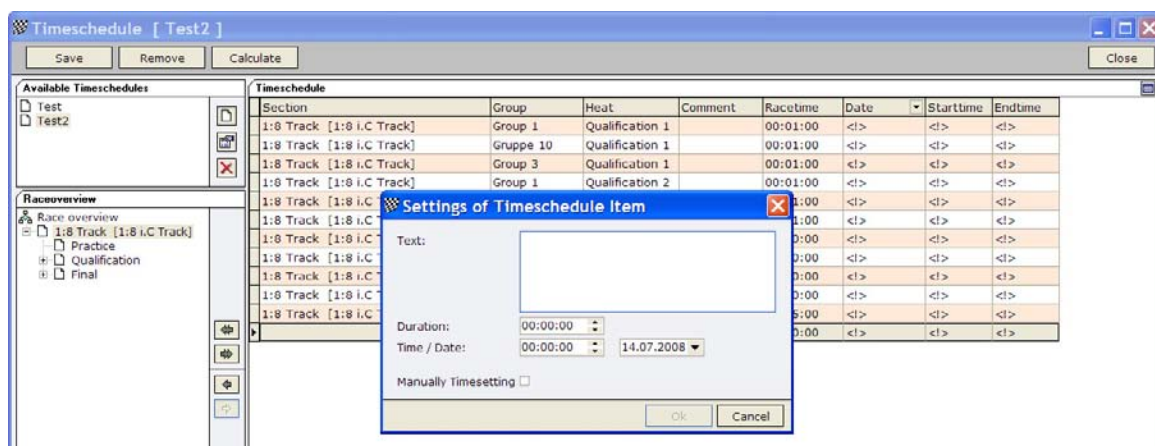

Close the window and now you can add the heats to the time schedule.

This is done using the raceoverview, selecting the heats and using the arrow-buttons to add the heats to the time schedule. Now click on the Calculate button on top of the window and the time schedule will be calculated automatically. You can also insert heats and finals for sections where no driver has already been assigned.

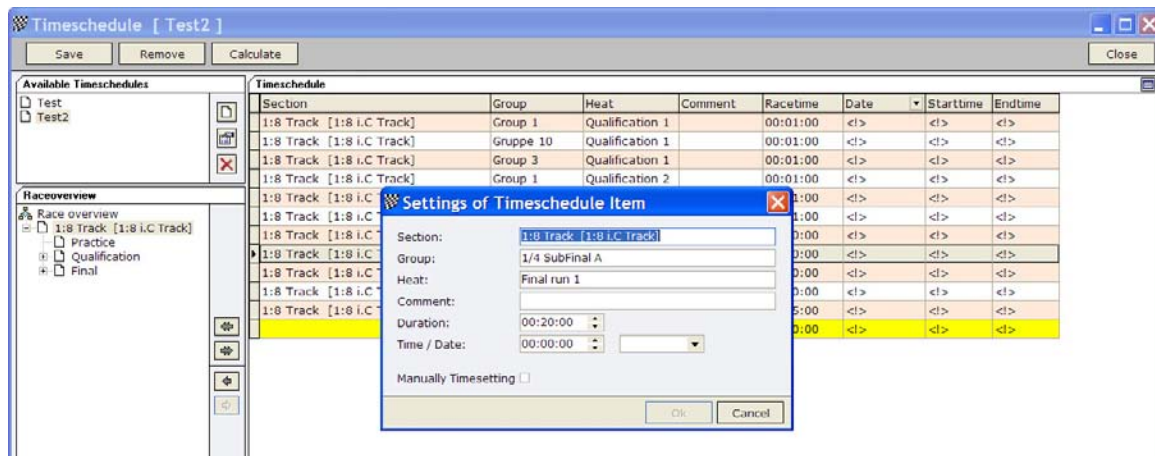

Now you maybe have to add additional entries to the time schedule or some changes have to be done.

To add a an additional entry manual (for example for the technical inspection) click on the arrow up button down below the other arrow buttons. You have to enter a text and the duration.

The positions in the time Schedule can be moved by drag&drop with the mouse. You can select multiple lines and move these. Also you can enter the time for an entry directly. Double click on the heat and in the following window you can change the duration and the time.

If you change single times or durations, please click on the calculate button again after the changes. All times of the time schedule will be calculated new. When you have finished your work, the time schedule must be saved. It can be printed through Display/Overview Print.

## 11.5.2 Race Analyses Reports

In this menu you can print a list of the recorded goals of all Pilots. These must be entered in the personal data of the inventory.

**Race Analysis Reports**

Please select Action

☒ List of recorded Goals of all Pilots

☐ List of rated Laps of all Pilots (Training, Qualy, Final)

Further on you can print a list of all counted laps of the drivers. This information is quite interesting for the speaker and for statistical use. Before you print you see a preview window. The print will be done by clicking on the print button.

**Race Analysis Reports**

List of all counted Laps per Pilot 23 / 23

#	Name	Firstname	Practice	Qualification	Final
Section : 1:8 i.C Track					
19	VVVVVV	vvvvvv	5	51	0

Print << Back Next >> Close

## 11.6 Mutations

### 11.6.1 Replace Pilot

With this function you can easily replace a driver in the loaded event by another driver. The driver to insert must be assigned in his personal data to the appropriate section.

A window opens where you have to select the section on top. Below all drivers of this section are listed. Click left on the driver you want to replace. This driver now appears in the field Current Pilot on the bottom of the window. Now click on the three point button at the right edge of the input field New Pilot.

A window with all drivers of the inventory data assigned to this section opens. Double click on the driver to insert. The driver is now in the field New Pilot. Please

note, that the driver to be inserted can not be an active driver of this section in the loaded event.

Lic	Name	Mechanic	Club	Block	Country	Team
ZZZZZZ	zzzzzz					
YYYYYY	yyyyyy					
XXXXXX	xxxxxx					
WWWWWW	wwwwww					
VVVVVV	vvvvvv					
TTTTTT	tttttt					
SSSSSS	ssssss					
QQQQQQ	qqqqqq					
PPPPPP	pppppp			EFRA		
OOOOOO	oooooo					

23 Datarecords

Exchange Pilot

Current Pilot: VVVVVV vvvvvv

New Pilot: RRRRRR rrrrrr

Attach Cancel

Clicking on the Attach button will replace the drivers. This means the current driver will be deleted in the driver list and in all heat arrangements and the new driver will be inserted.

## 11.6.2 Replace section

Here you can replace a section with another section. The new section will be assigned to all drivers of the "old" section and all data of the drivers will be overtaken.

Replace Section

Please select the section, which has to be replaced

Current Section: EGTWMO [Elektro-Glattform Tourenwagen Modified]

New Section: 1:8 Track [1:8 i.C Track]

Protocol

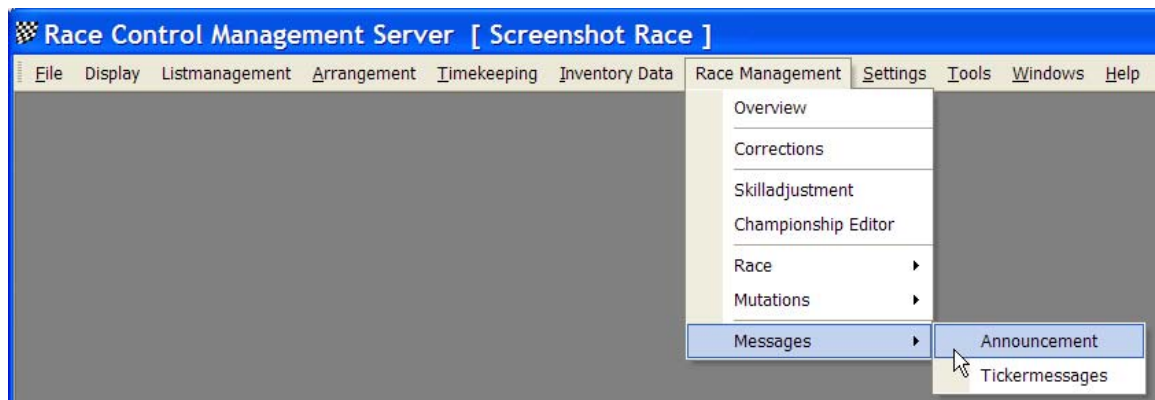

Attach Cancel

Chosse the section of the event in the top line. Then select the section you will use below. By clicking on "Attach" the procedure will be performed.

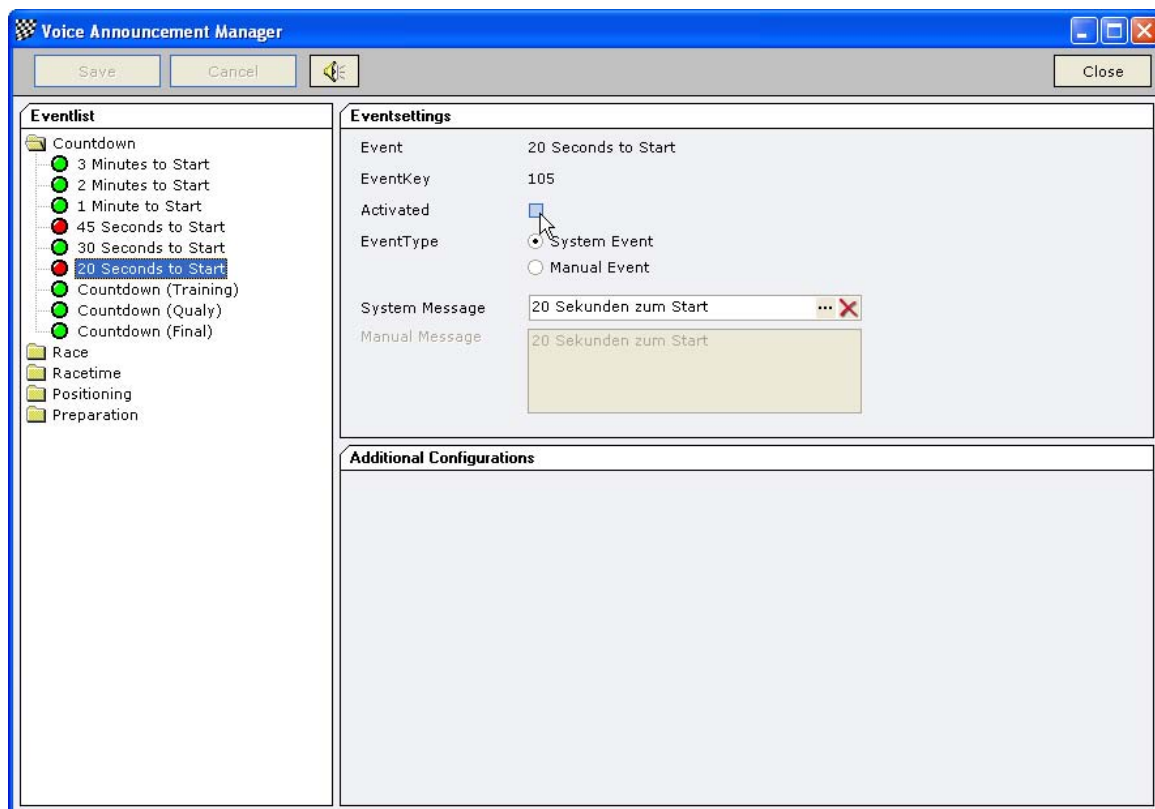

## 11.7 Messages

Here you can define the voice announcements of RCM Ultimate and the tickermessages send to RCM Publisher.

### 11.7.1 Announcement

RCM Ultimate supports automatic voice announcements for the sequence of the race. These can be adjusted here. The window lists the events in the left column. In the right column you see the settings of a event selected in the left column.

In the left column the events are indicated by small circles. A green circle means that this event will be announced. A red circle means that this event will not be announced. The single sections like Countdown, Race etc. can be enlarged with a double click on the section. If you select an event by clicking on it, you can activate (will be announced) in the left column. If you remove the check mark after activated, the event will not be announced. For some events (for example Race/Start of Race) there are additional configurations available. These will be shown in the lower part of the right column. You can activate or deactivate this additions. All other settings are used by the system and should not be changed.

## 11.7.2 Tickermessages

RCM Ultimate can send messages to RCM Publisher to present additional information to the drivers and the mechanics.

Message: Type the text in here you want to have displayed in RCM Publisher.

Tickermessage: Indication, if the message is shown as Tickermessage, This is a faded in rolling writing.

Messagebox: The message will shown in a new window in RCM Publisher. With this setting it is also possible to send pictures to make promotion for your sponsors in breaks of the race.

Show message permanently: The message will displayed by RCM Publisher as long as you send a new message.

Displaytime: Here you can define, how long the message is displayed by RCM Publisher.

Ticker active: Switch on the ticker. If deactivated the ticker is switched off.

Circulation Speed: Speed of the rolling writing.

Tickercolor/Backgroundcolor: The text will be displayed in the selected color on the selected backgroundcolor. Please note, that yellow is reserved for records.

Clicking on the Send-button will send the message to all connected RCM Publisher. The message is deleted by clicking on the clear button.

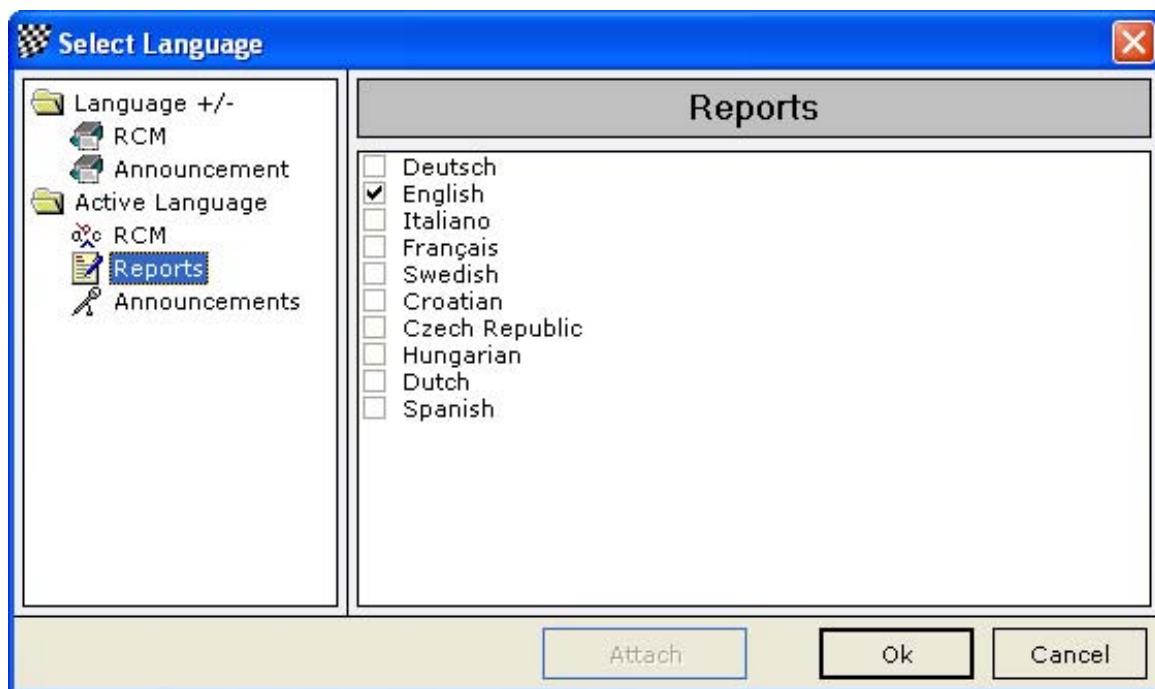

## 12 Settings

In this menu you find very important configurations like the connection settings for the time keeping decoder and the control of additional RCM-Software which can be connected to RCM Ultimate. Here are the settings for the printer interface and you can define typefaces and colours. Further on you can select the language of the program as well as the reports and the announcements.

### 12.1 Language

With Configuration/Language you can set the languages used by RCM Ultimate.

Language +/- allows you to create a new language (please refer to the Language Editor), delete a language and to export a language file. The same can be done for the announcements.

By clicking on Active Language/RCM in the left column of the window you can set the language used for the application. This means the language used for all the text in the menus and windows of RCM Ultimate. Just activate the required language in the right column of the windows. The language will be changed by pressing the attach button.

If you mark Active Language/Reports in the left column, you can determine the Language used in all of the reports of RCM Ultimate. For an international race you should select English for the reports. To set the report language activate the wanted language and click on the attach button.

If you mark Active Language/Announcements in the left column, you can

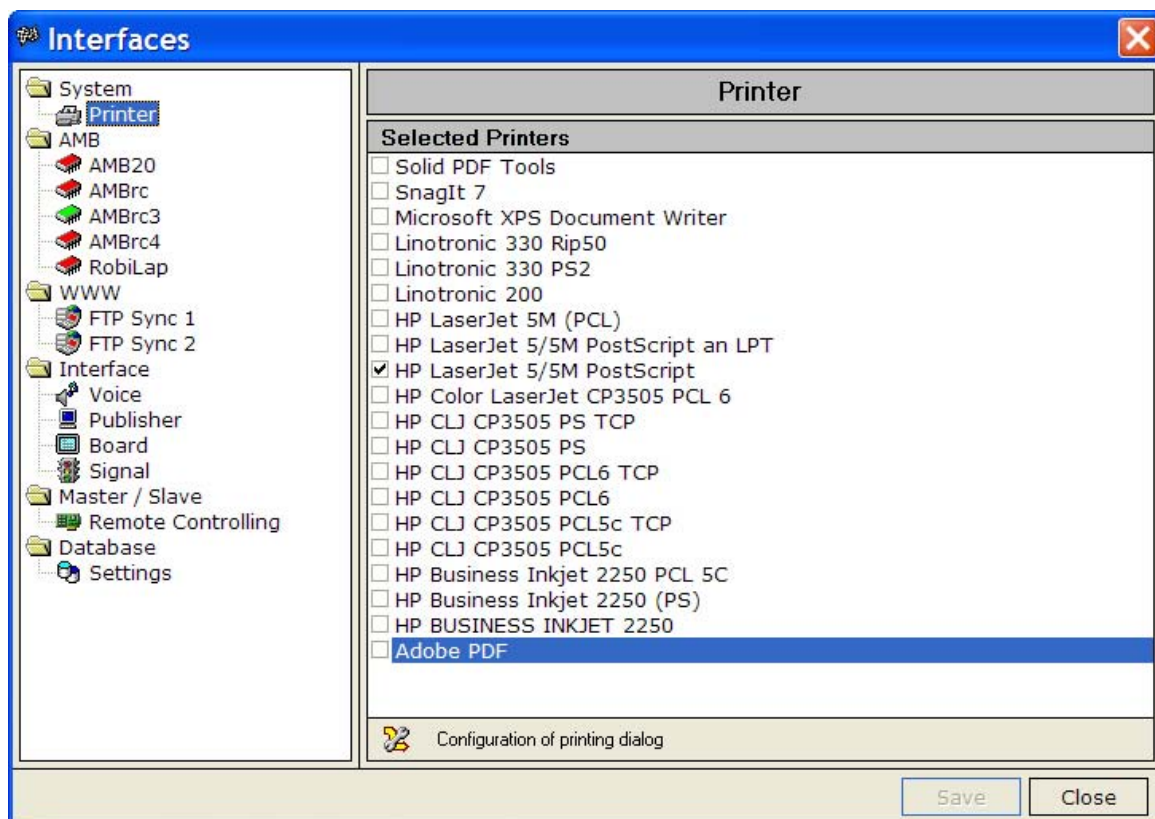

determine the Language used in all of the announcements of RCM Ultimate. For an international race you should select English for the announcements. To set the announcement language activate the required language and click on the attach button.

## 12.2 Interfaces

Opens a window where you can select all connections RCM Ultimate is using.

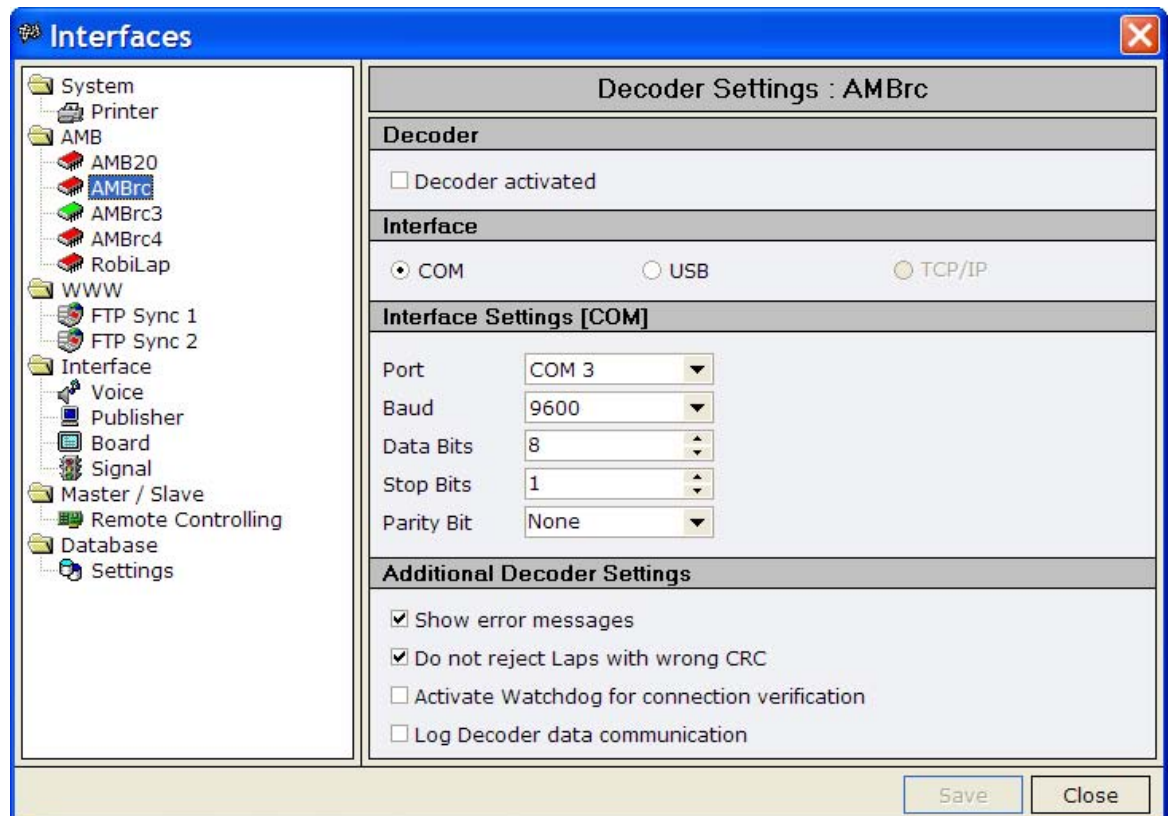

### 12.2.1 System/Printer

Clicking on Printer you see in the right column all printers of your Windows-System. Activate the printer you want to use for RCM Ultimate. You can activate more than only one printer. Please note, that RCM Ultimate is only using the printers activated. If no printer is activated, you can not make any printouts. After selecting one or more printer you have to save the settings by clicking on the save button. By clicking below on configuration of printing dialog you can set the number of copies for all selected printers.

## 12.2.2 AMB

Here you configure the Decoder your are using.

The following decoder can be used with RCM Ultimate:

AMB20 (Induction principle), is the predecessor of the AMBRC

AMBRC (Induction principle), suitable for 1/12 up to 1/5 scales [USB/RS232]

AMBrc3 AMB Decoder generation (Induction principle) for personal transponders [LAN/RS232]

AMBrc4 new AMB Decoder generation (Induction principle), suitable for 1/12 up to 1/5 scales [LAN/RS232]

RobiLap (Infrared principle), suitable for minor scales like as 1/18 and 1/24 [RS232].

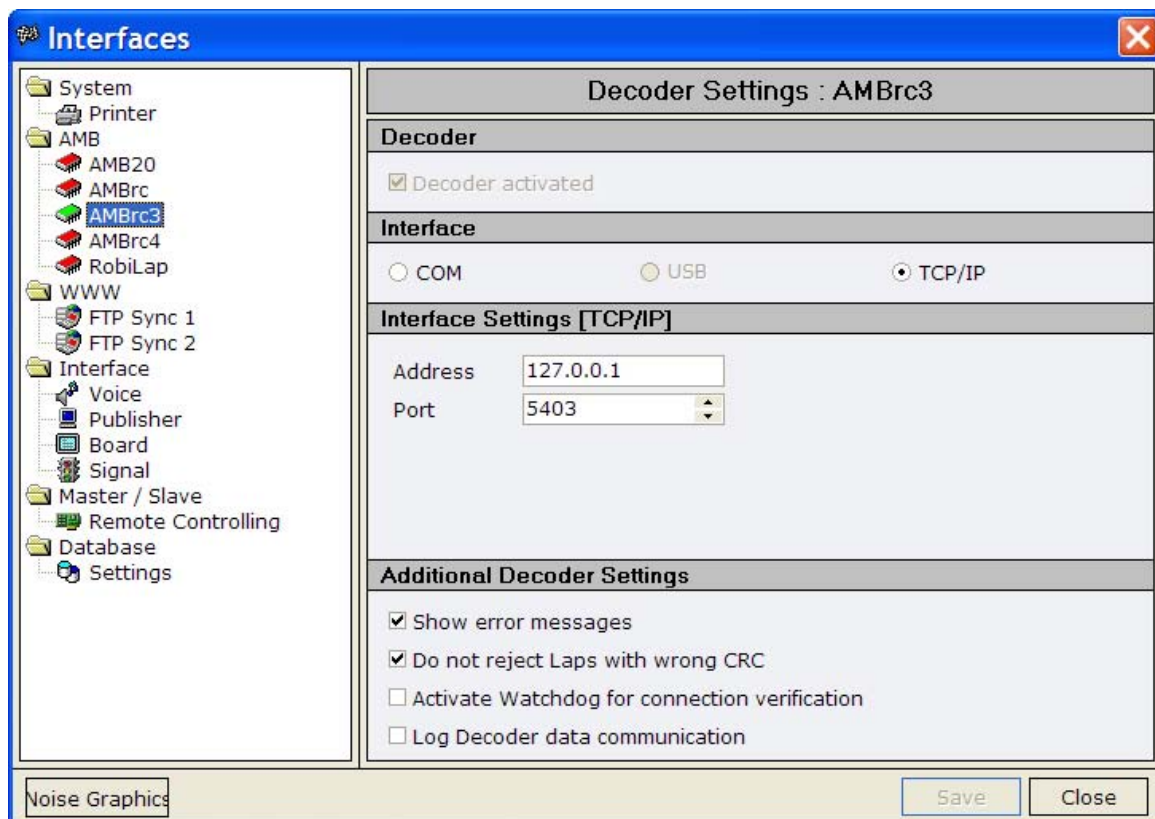

Click left on the decoder you are using in the left column. Now you can make the settings in the right column. First of all activate "Decoder activated", select the interface and determine the interface settings (port). Regarding the interface settings please refer to the user manual of your decoder.

With additional decoder settings you can specify if error messages are displayed, laps with a wrong CRC (CRC is a checksum the decoder is transferring with the data of a datastream. If the transfer from the decoder to the computer is bad, the checksum can be wrong) are rejected and if complete data communication is logged. This logfile is placed in the folder RCM Ultimate\Logfile and further in the folder with the name of the decoder.

In addition you can activate a watchdog. A message will be displayed, if the connection to the decoder is lost. Besides of that, the status of the connection is also displayed in the bottom line of RCM Ultimate.

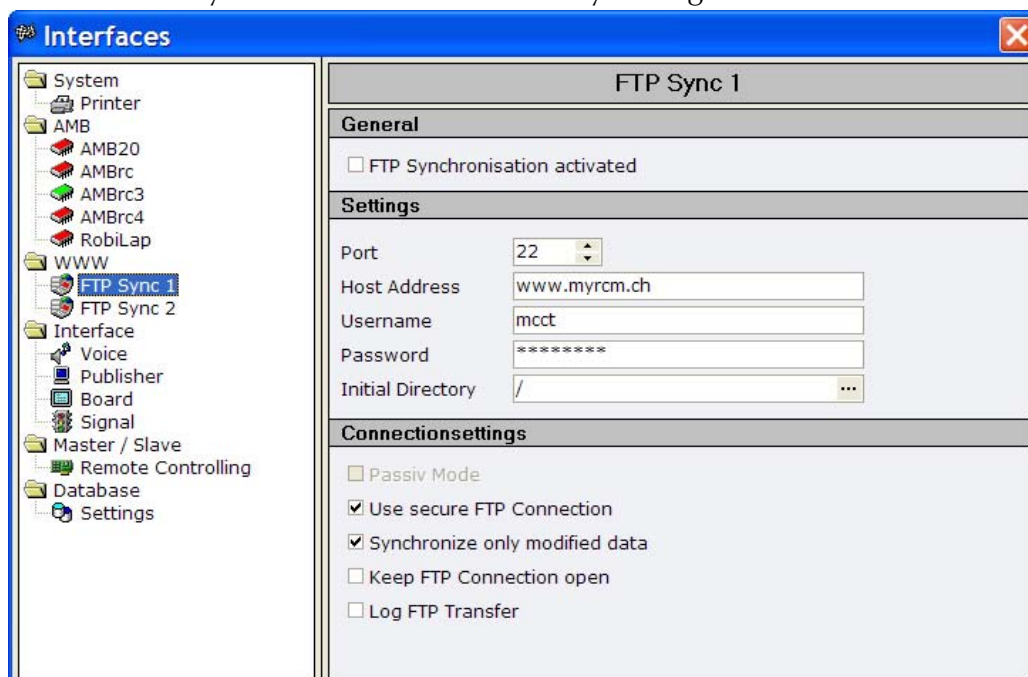

If you use a TCP/IP-connection to your decoder it is very important to set the IP-Address of the decoder. This address has to be in the same segment as the computer. The IP-Address can be selected in the decoder, please check the manual of your decoder.

The proper work of the decoder can be checked with the transponder logfile, which can be activated by pressing the F4 key.

### 12.2.3 WWW

RCM Ultimate supports the publishing of the race results directly on an internet website. Here you can define the necessary settings.

FTP Synch 1: This is set by default for the access to MyRCM. You have only to enter your Username and your password, which you have got from RC-Timing. If your computer has access to the internet, you can activate the FTP Synchronization (on top of the right column). The loaded event will now being published auf MyRCM. This will take same time. Please note, that you activate the FTP Synchronization only if you have loaded an event which should really be published on MyRCM. FTP Synch 2: Works identically to the settings just described. With this settings you can publish the race results on your own website in addition to MyRCM. Please contact the administrator of your website for the detailed settings needed.

## 12.2.4 Interface

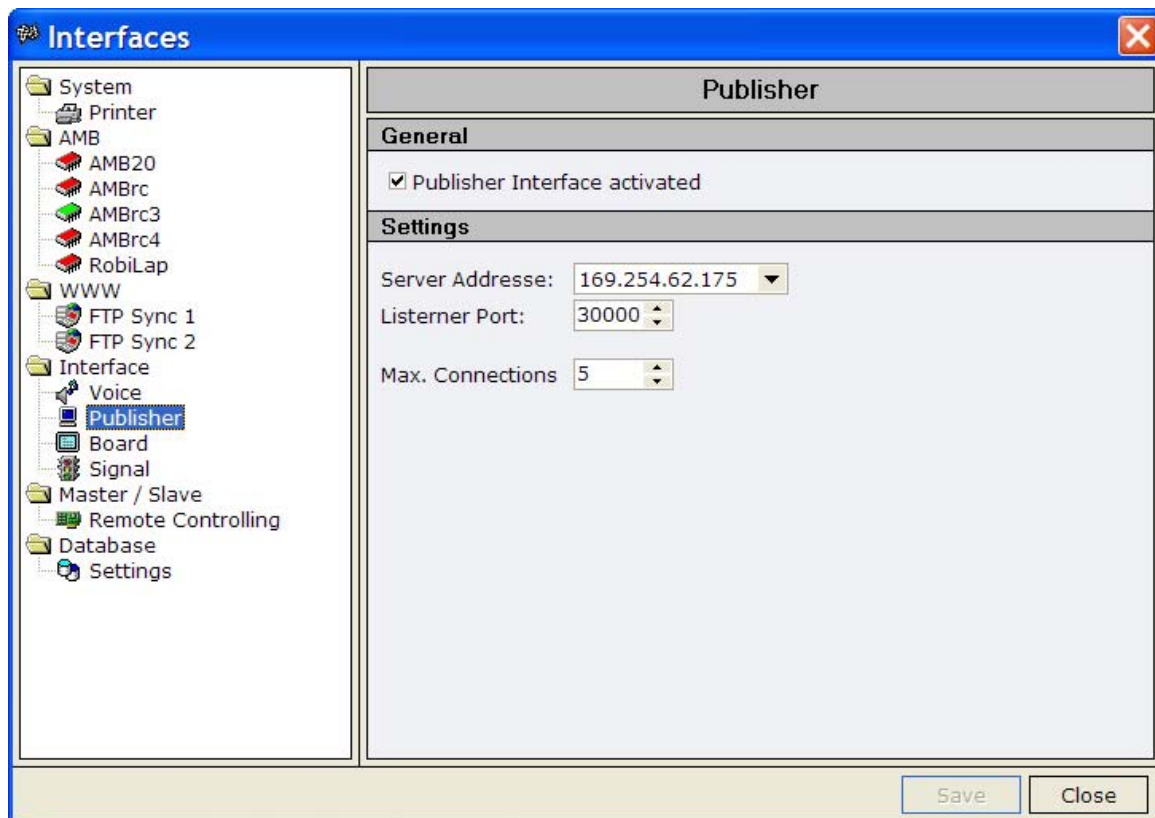

With RCM Ultimate you can use several client-programs. This optional programs provide you with additional features. RCM Ultimate Supports RCM Voice, RCM Publisher, RCM Signal and RCM Boards as well as a remote data connection for RCM Registration. These programs have to be ordered separately.

RCM Voice allows a voice response of important events during a race. For example it announce automatically the countdown to the start, the remaining runtime, lap times and so on. The announcement can differ from the automatic announcements of RCM Ultimate,

RCM Signal controls lights and a horn.

With RCM Publisher you can built up information terminals for the drivers. This program displays the ranking and other useful information of the race course. You can make the following settings (please refer also to the user manual of the client program):

RCM Board supports large information displays.

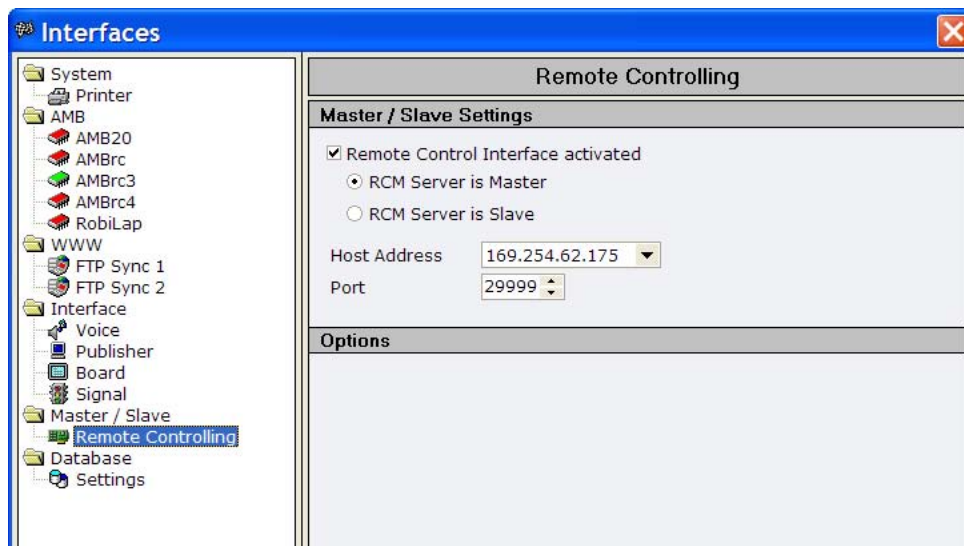

The following settings for this programs have to be made in RCM Ultimate (please refer to the user manual of the client program too).

Interface activated: Must be activated to use the client. Not activated means, that RCM Ultimate does not support this program.

Server Address: The IP address is automatically set according to the settings of the network of the computer. You have to set it accordingly in the client program.

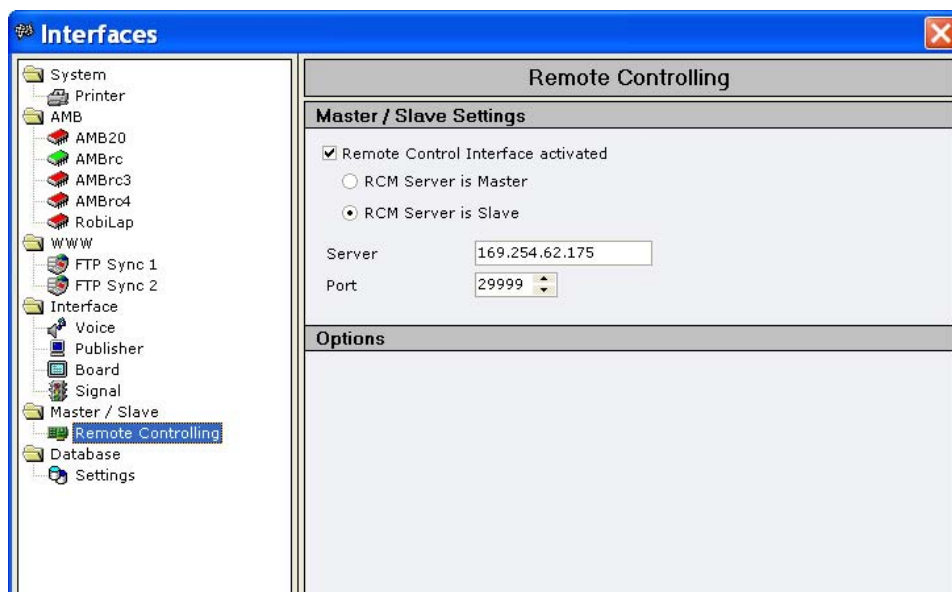

Port: Every client is connect by a unique port. You should not change this setting cause the clients will only be recognized with the correct port number.

Max. Connections: You can specify how many clients can be connected to RCM Ultimate. Keep this number as low as possible for a good network performance. If your network is not powerful enough and the number of connections is very high, you risk, that connections will be terminated.

### 12.2.5 Master/Slave/Remote Control

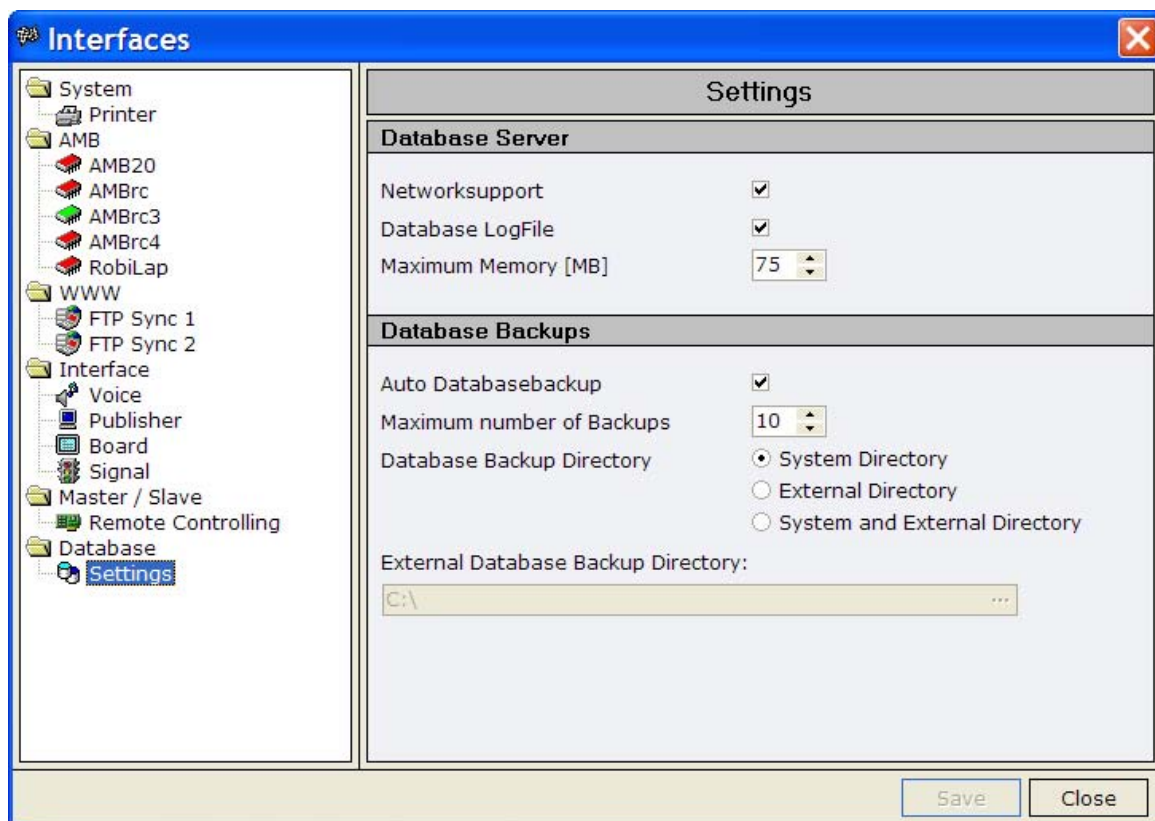

With remote controlling it is possible to control a second computer which is also running RCM Ultimate for a second time keeping system. It is necessary, that you run the same version of RCM Ultimate on both computers and the same event must be loaded. The data must be absolutely identically, please transfer the event via data export and import it to the second computer. Both computer must be connected via a network. In RCM Ultimate of the first system you activate RCM Ultimate is Master and you activate Remote Control Interface is activated.

In RCM Ultimate of the second system, the settings are as follows: Remote Control Interface must be activated. RCM Ultimate is Slave must be also activated. Under Host Address you have to enter the TCP/IP-Address of the Master RCM Ultimate. With Options you can define the events which are controlled automatically. Please note, that RCM Ultimate Slave takes not only the sequence of the events over from RCM Ultimate Master. Changes of frequencies, transponders, weather conditions, runtime and offtime will be directly transferred to the slave. The arrangement of the heats etc. (of course without the timekeeping data) can be transferred with "Tools/ Transfer Database to Slave".  
The status of the master-slave connection (please note: you maybe have to restart RCM Ultimate after activating the remote control) is shown in the bottom line of RCM Ultimate under "Remote:".

### 12.2.6 Database/Settings

These settings are necessary to control database connections and to arrange the database backups of RCM Ultimate.

**Networksupport:** For clients using the direct database connection you have to activate the networksupport. RCM Registration or RCM Tech are using the direct database connection. If you use one of these programs, you have to activate the networksupport.

**Database Logfile:** When this option is activated, all faulty transactions of the database will be written in a logfile. Such transaction must not be necessarily wrong (for example: if it is searched in an empty list for a name, the result is ZERO and automatically a remark is written in the logfile). If there is a general problem, this logfile can help to analyze the error conditions. The logfile is saved in the folder RCM Ultimate\Logfile.

**Maximum Memory:** The filesize of the logfile can be limited. If the file gets bigger, the file is deleted and a new logfile will be created. Please do not configure very

large files, cause the writing process will take a long time with very big files.  
Auto databasebackup: We recommend to activate this feature. After each heat a backup of the complete database will be created. You can define, where the backup files are stored. We recommend to use in any case the system folder (RCM Ultimate\Backup) and when necessary an external folder. You have to select the external folder in the lower input-field.

For example due to a power failure the database can be corrupted. To reactivate a backup you have to close RCM Ultimate. The database-backup is a ZIP-file and can be opened by double clicking on the filename in Windows Explorer. You have to extract the complete content of the ZIP-file to the folder RCM Ultimate\Database. The existing files will be overwritten and you can use the database again after a new start of RCM Ultimate. In case of a corrupt database you only have to re-run the last heat.

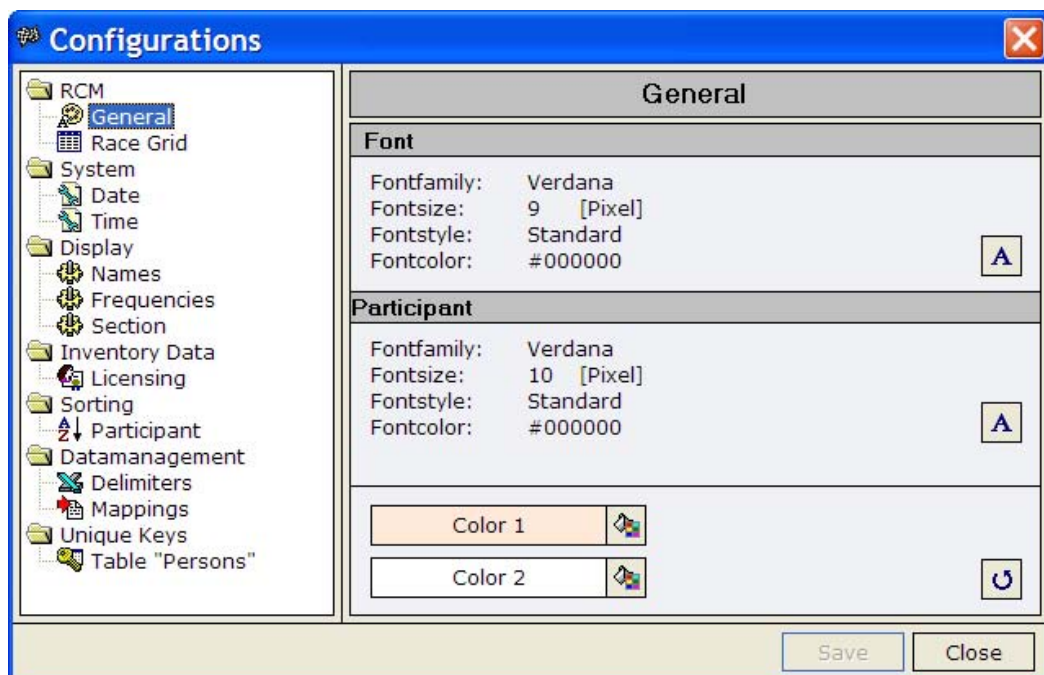

Maximum Number of Backups (Default setting = 20): The number of how many backups should be kept can be defined here. If the number is reached, the oldest file will be deleted and the new file is created.

## 12.3 Configurations

The configurations allow you to change several basic settings of RCM Ultimate.

### 12.3.1 RCM/General

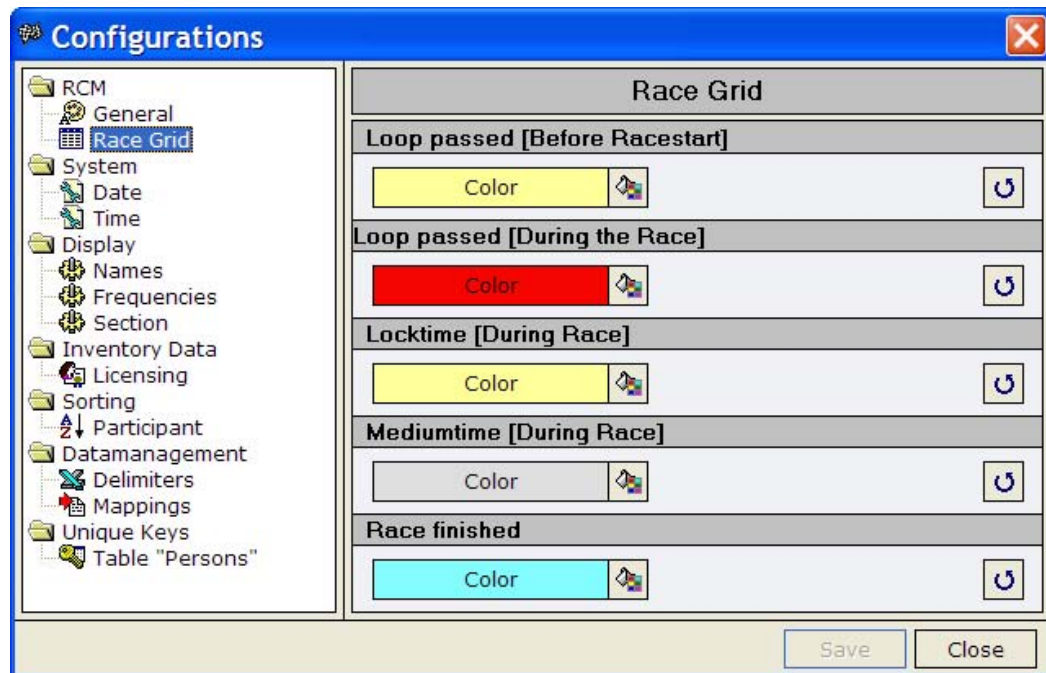

Marking in the left column General, you can set up the fonts, the fonts size and some colours used by RCM Ultimate. You can set the Fonts for tables independent from the other text. The colours shown on the bottom of the column are used to make tables better readable. If you want to change these colours, please use light and different colours.

### 12.3.2 RCM/Race Grid

The colours a driver will be marked in the time keeping can be set here.

Loop passed (default light yellow): When a driver passes the loop and the transponder number is registered to a driver, it will be marked in that colour. This makes it easy to check whether all drivers are on the track or not.

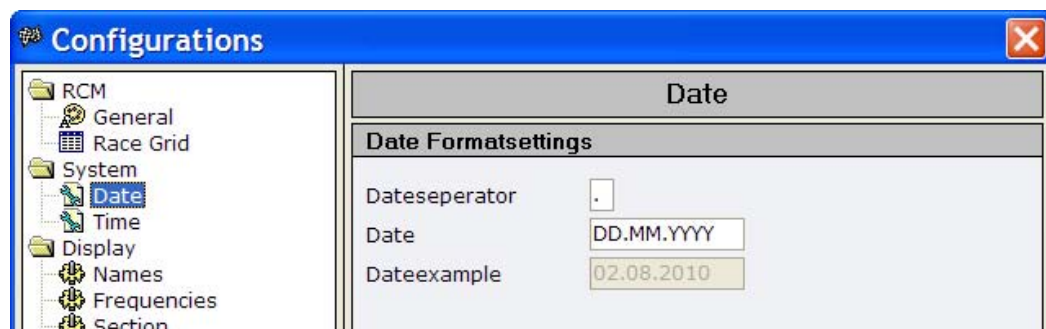

Locktime (default red): This marking is visible for the locktime. In between this time no additional laps are counted but in the lap time logfile these laps are visible and marked with "NOK". This means,, that these laps will not be counted for the result.

Mediumtime (default grey): Drivers usually drive their laps continuously in the time frame. This time frame is the medium time plus or mines a certain time ratio. If this medium time plus the ration time is expired the driver line will be marked in light grey and means the driver was slower. This can be an accident, a pit stop or a roll over situation.

Race finished (default light blue): When the race time is over and the driver passes the last time the loop then the driver is marked light blue and has completed the race. Additional laps will not be counted anymore, even if the driver continues racing.

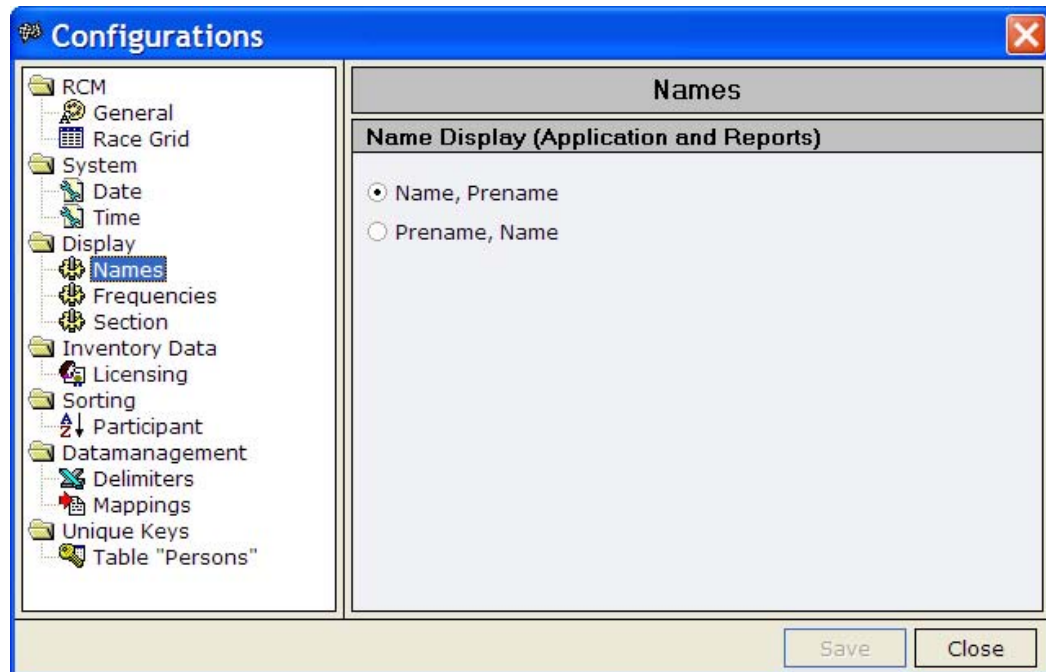

### 12.3.3 System

With Date and Time you can define the format of the output. Please change these definitions carefully. Maybe you can not see anymore output of any date or time.

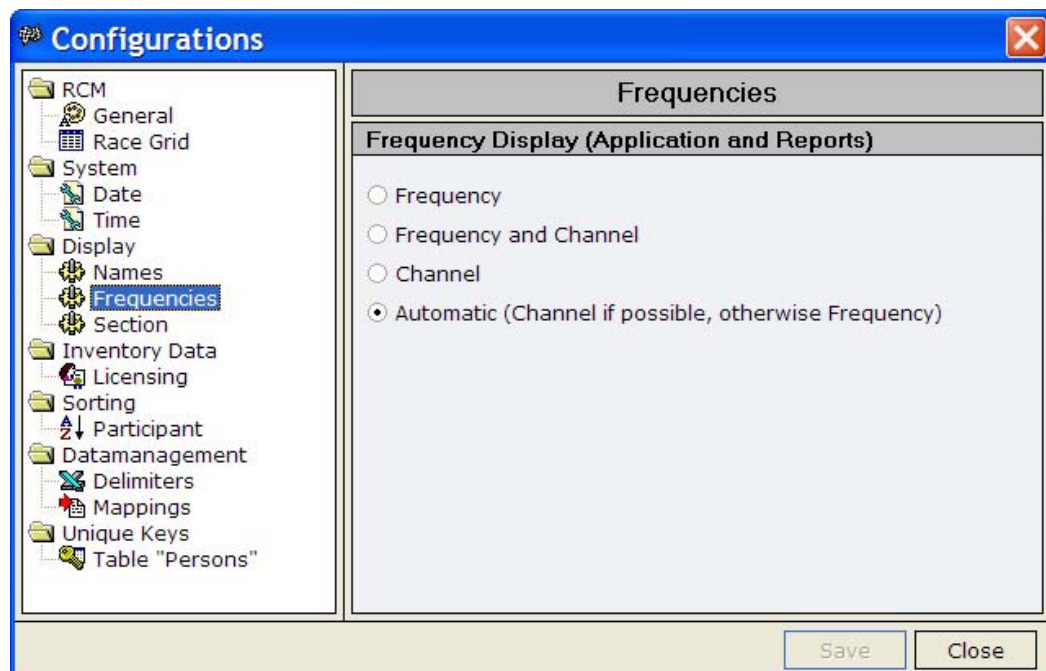

### 12.3.4 Display

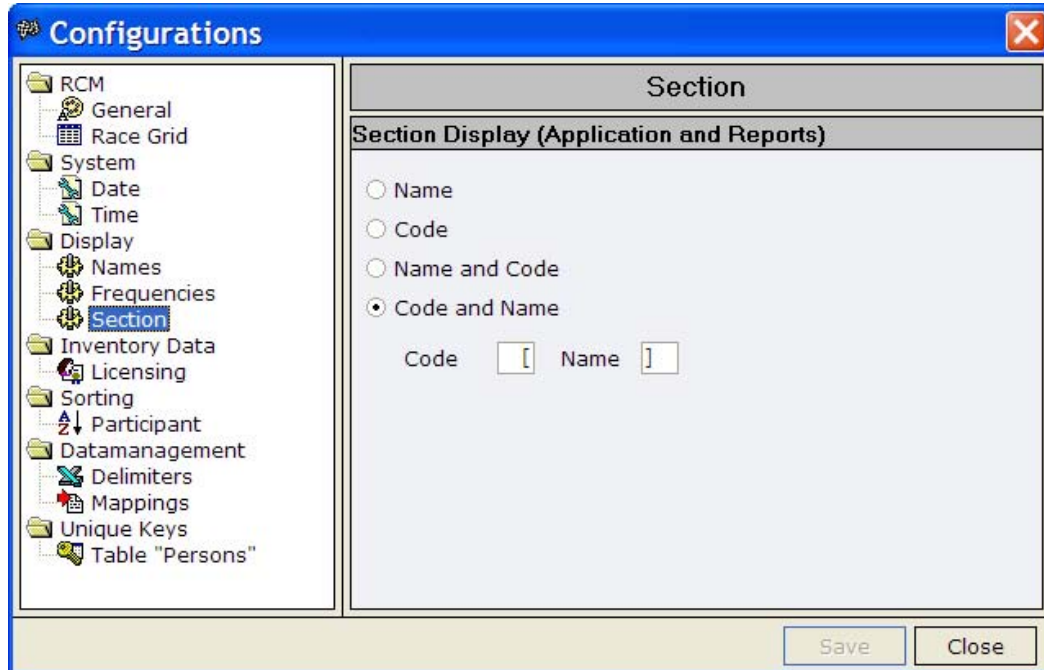

Names: Here you can define the order of Prenom and Name.

Frequencies: You can select whether to work with channel numbers or frequency. We recommend to use the automatic setting. With this setting you can enter the channel number as well as the frequency and RCM Ultimate recognise the correct frequency by itself.

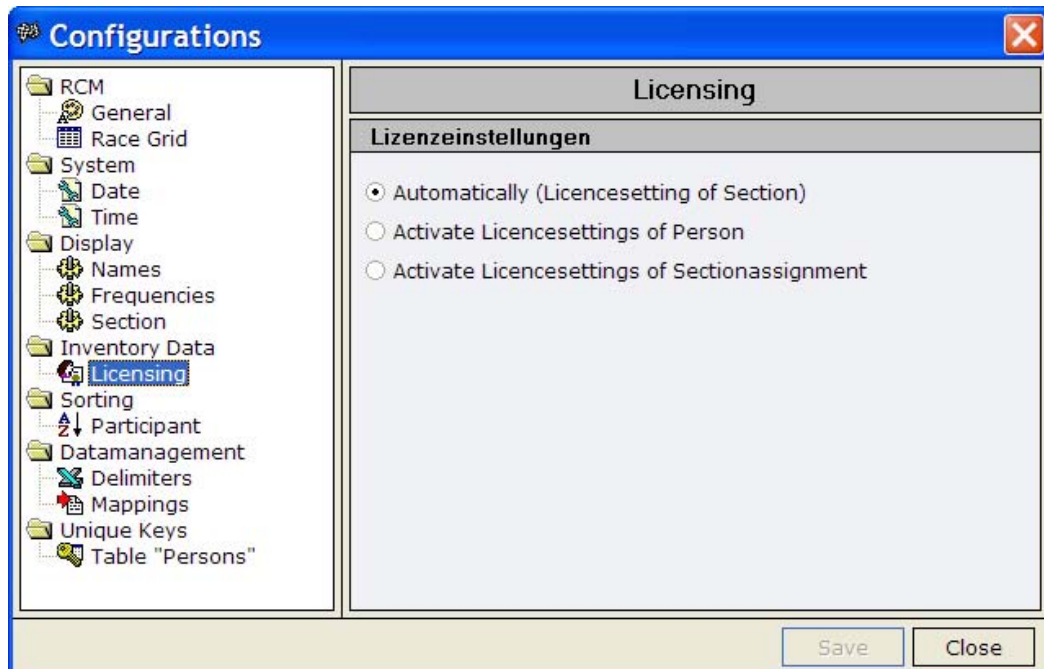

Section: You can define the display format for the section.

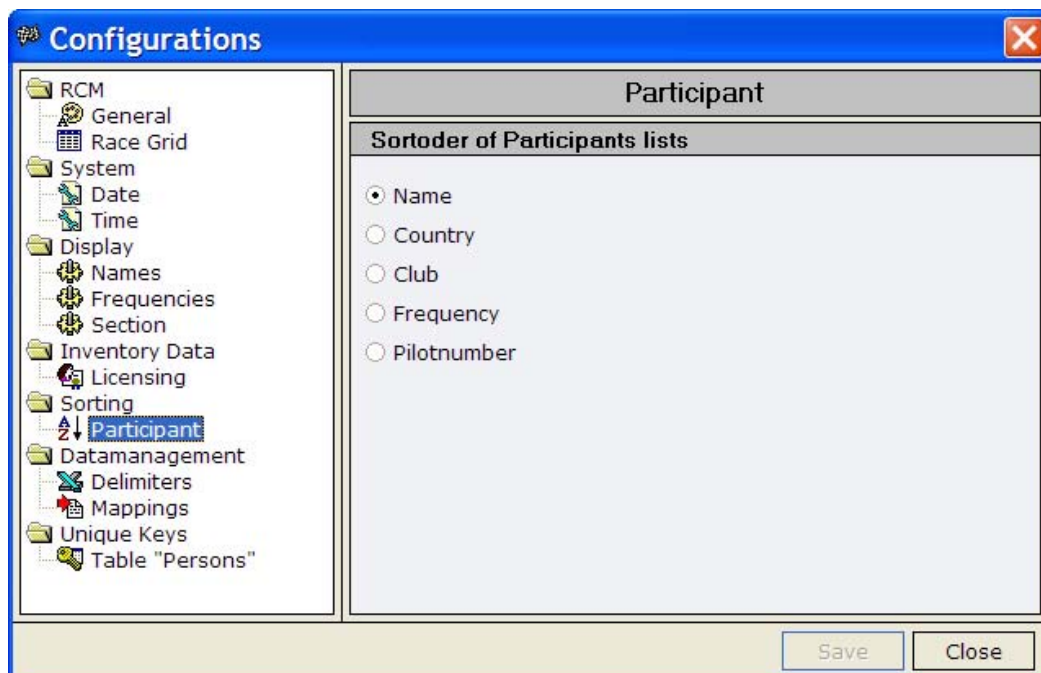

### 12.3.5 Inventory data/Licensing

Here you can select whether the license is assigned to the person or to the section. Further on there is an automatically setting available. Using this the license depends on the settings in the respective section. All explanations in this manual regarding the sections and the personal data refers to this automatic setting.

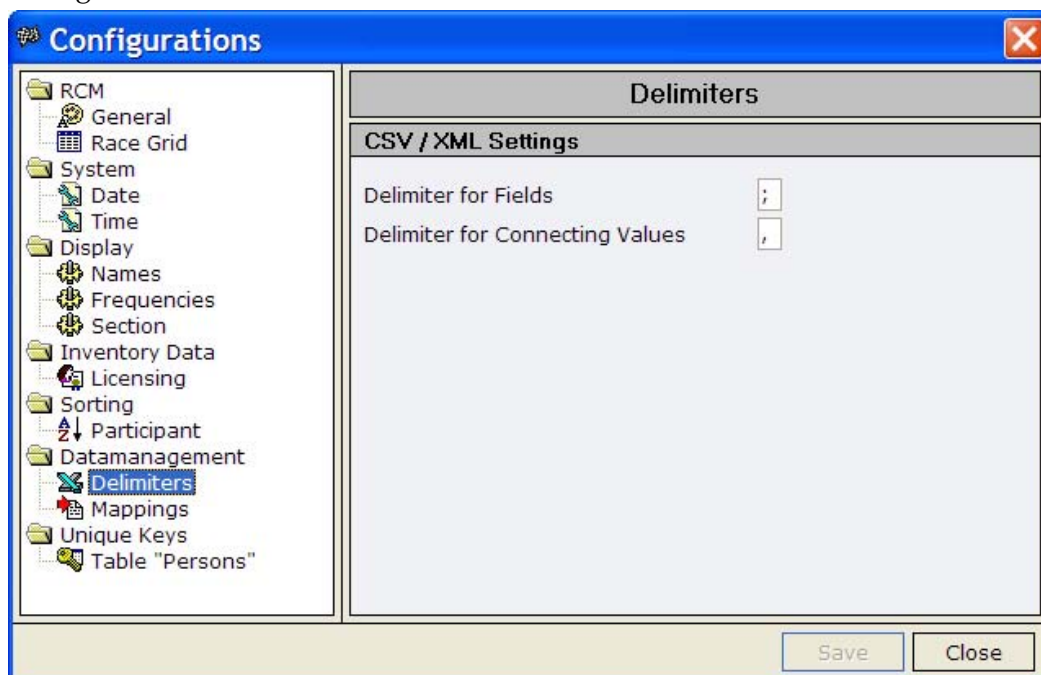

### 12.3.6 Sorting/Participant

You can select the sorting order used for the drivers in lists and reports. This can be done by name, country, club, frequency and pilotnumber.

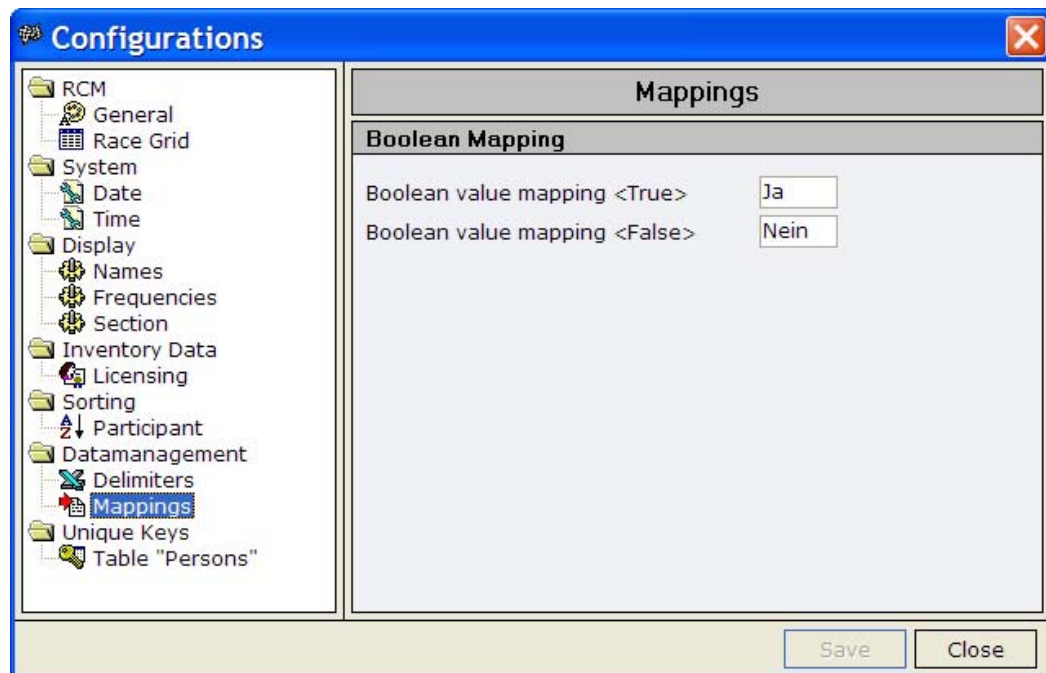

### 12.3.7 Datamangement

Delimiters: You can enter the delimiters used in CSV- or XML-files. You should not change this.

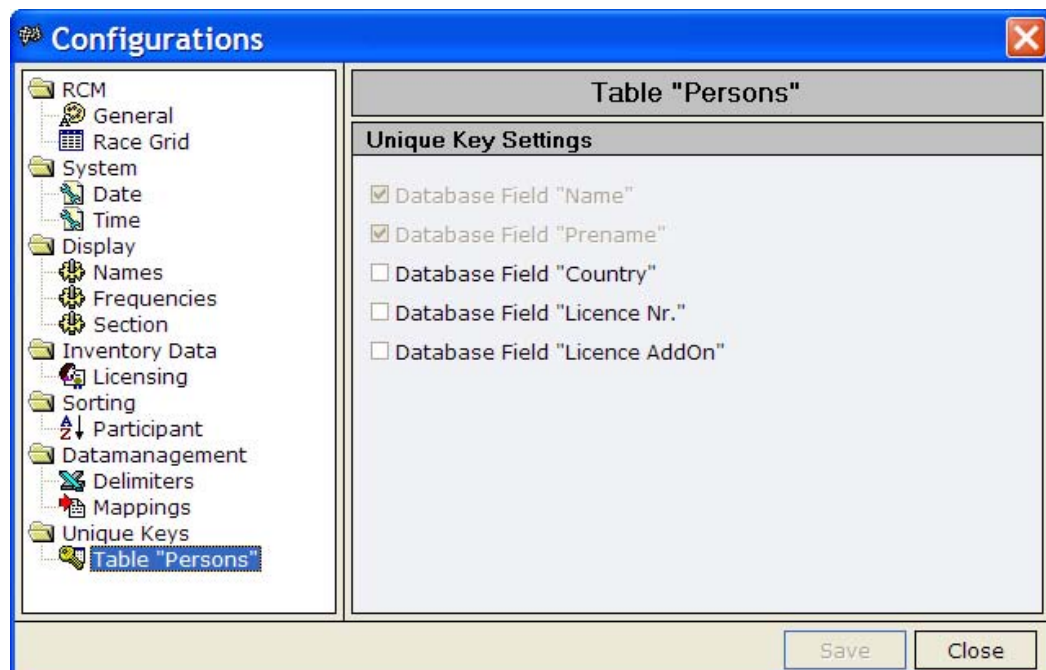

Mappings: The values should not be changed.

### 12.3.8 Unique keys

Additional to the keys name and prename you can generate keys for country and License number. This can help to search the right person especially with a big number of persons in the inventory data.

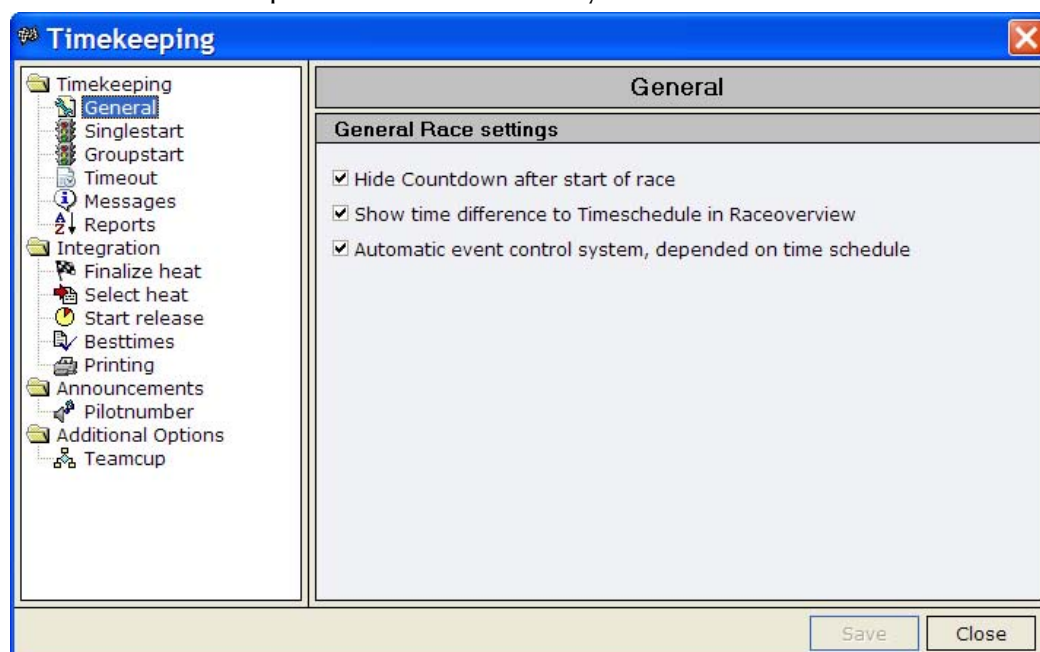

## 12.4 Timekeeping

The settings for the timekeeping and the teamcup will be done here. Double click in the left column the section and you can enter the setting in the right column. Here you can select a fully automatic procession of all races according to a created time schedule.

### 12.4.1 Timekeeping/General

Here you can define if the countdown-window in the timekeeping window is closed after starting a heat or not. Further on you can set if the time difference to the time schedule is displayed.

If you want RCM Ultimate to control the race process fully automatically, you have to activate "Automatic event control system, depended on time schedule. If this is not activated the other items in Timeschedule are not active. To use the automatic, you only have to select the Timekeeping survey for practice, qualification of final. The races are now processed automatically.

## 12.4.2 Timekeeping/Singlestart

Take into account the delay time for Raceend announcement: The end of the race will be announced after the delay time or after all cars have finished the race.

Reset race time with all pilots: The display as well as the announcement of the remaining racetime is based on that driver which will pass the finish line the last one.

Reset race time just with the first pilot: The display and the announcement of the remaining racetime is based on the first driver in a race.

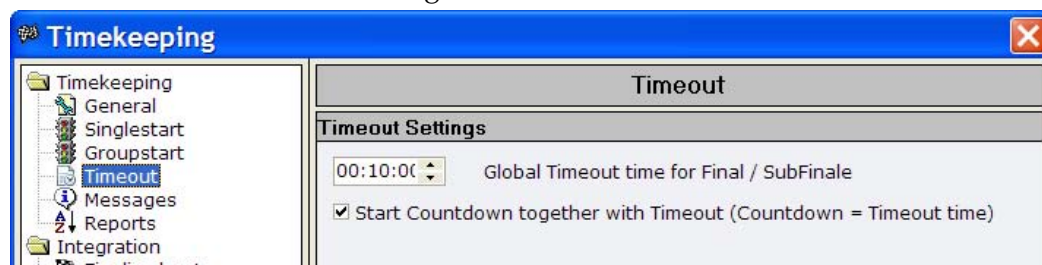

## 12.4.3 Timekeeping/Groupstart

Take into account the delay time for Raceend announcement: The end of the race will be announced after the delay time or after all cars have finished the race.

## 12.4.4 Timekeeping/Timeout

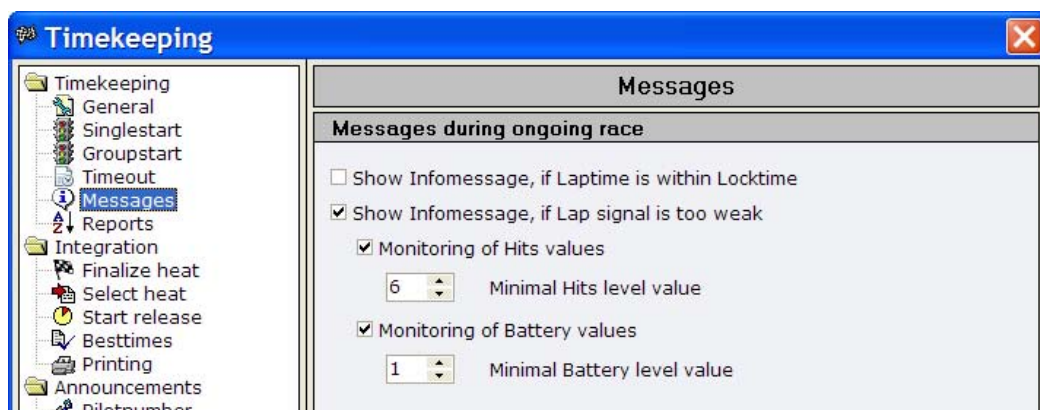

Here you can enter the time for a timeout in Finalheats. You can also start the countdown new when entering a timeout for a driver.

## 12.4.5 Timekeeping/Messages

Show messages if laptime is in within the loctime: You will see a message if a driver has a laptime shorter the the locktime.

Show infomessage if lap signal is too weak: Messages are displayed, if the transponder signal is very low. You can select if the "hits" and/or the "battery value" is used. For both you can set a limit.

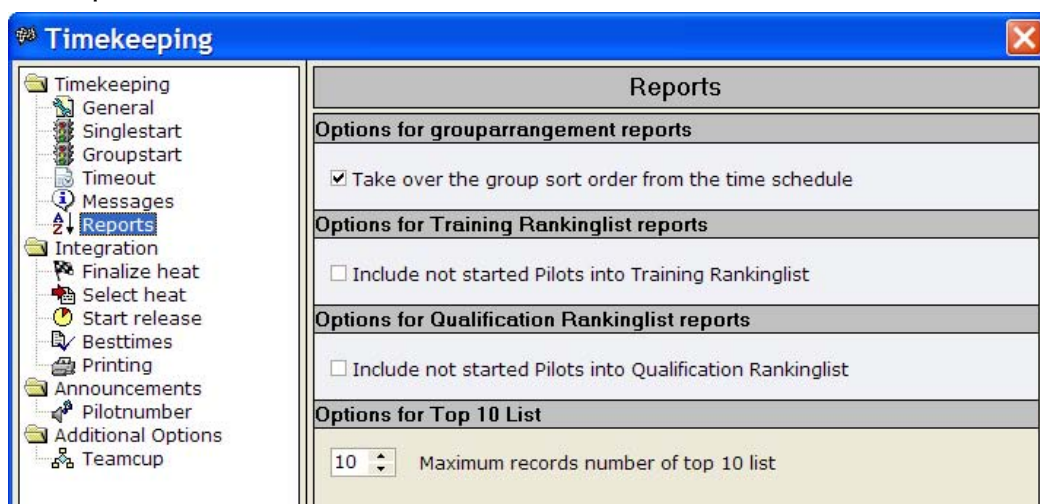

### 12.4.6 Reports

Here you can define whether the group sort order is done according to the time schedule or not.

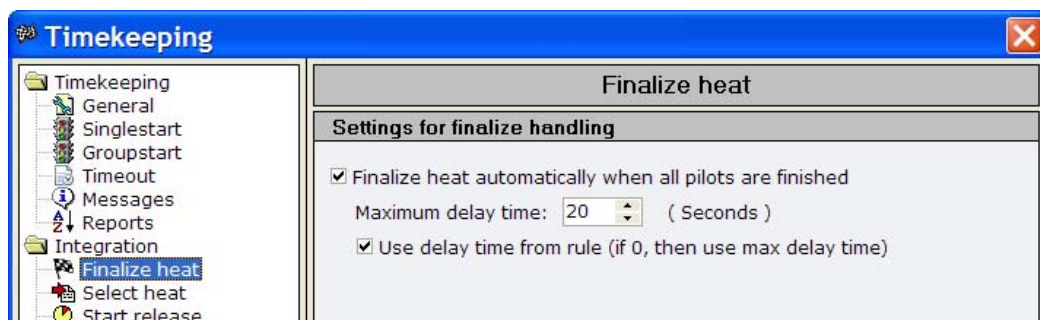

Include not started pilots in the rankinglist: For practice and qualification it can be set, whether to print not started pilots or not.

Further on you can set the number of drivers in the top 10 list at the end of each result printout.

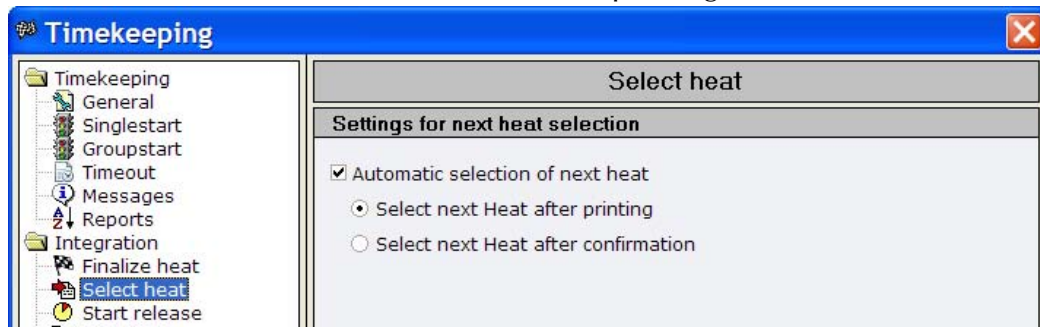

### 12.4.7 Timeschedule/Finalize heat

Here you can select if a heat is automatically finalized when all drivers have finished. Further on you can define the maximum delay time (follow up timer after the race) in seconds and define whether this time is used or the delay time set in the rule.

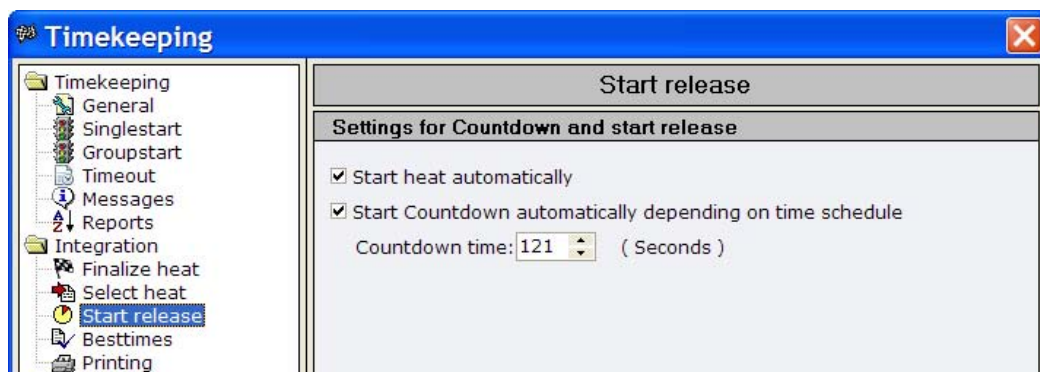

### 12.4.8 Timeschedule/Select heat

RCM Ultimate can select the next heat automatically. If this feature is activated you can choose whether it should be done after printing or after a confirmation.

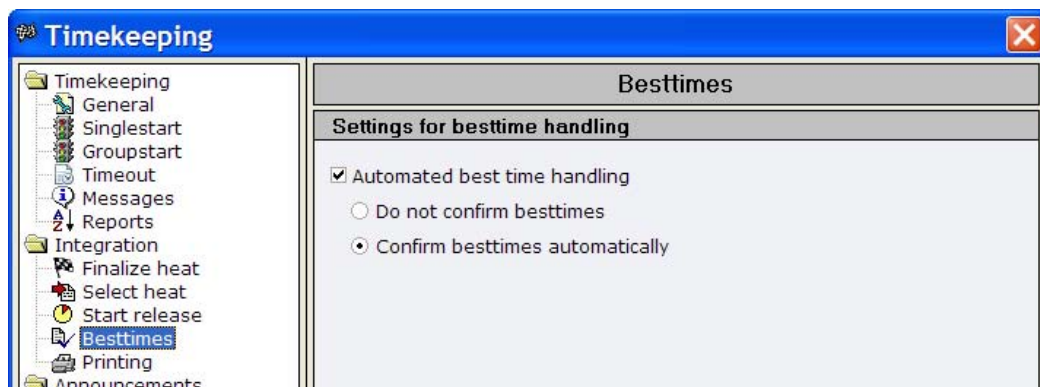

### 12.4.9 Timeschedule/Start race

RCM Ultimate can start a heat automatically for your. You have to select if this should be done after a countdown and which countdown time should be used. You can also activate that a countdown is started accordingly to the time schedule. Please note, that the break between two heats must be bigger than the countdown time plus the followup time plus 20 seconds.

### 12.4.10 Timeschedule/Besttimes

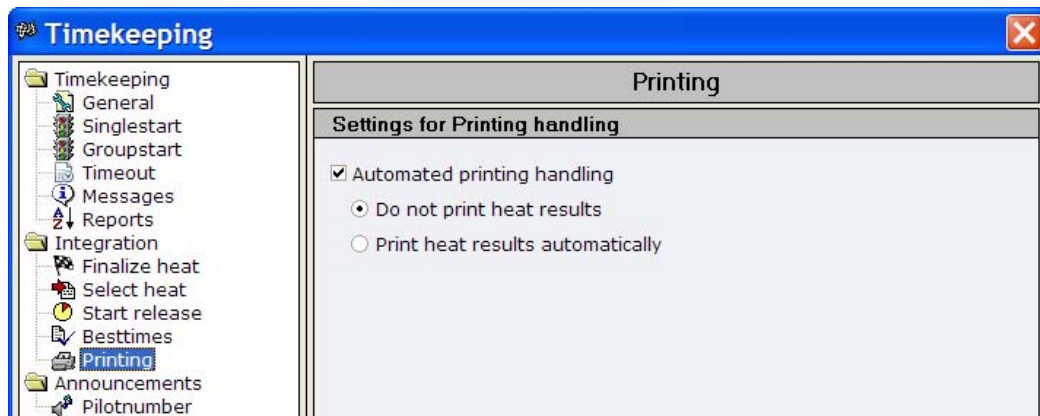

Normally new besttimes (records) in a heat must be confirmed. If you activate „Automated best time handling“ you can select whether RCM Ultimate does confirm the best times automatically or the best times will not be confirmed.

### 12.4.11 Timeschedule/Printing

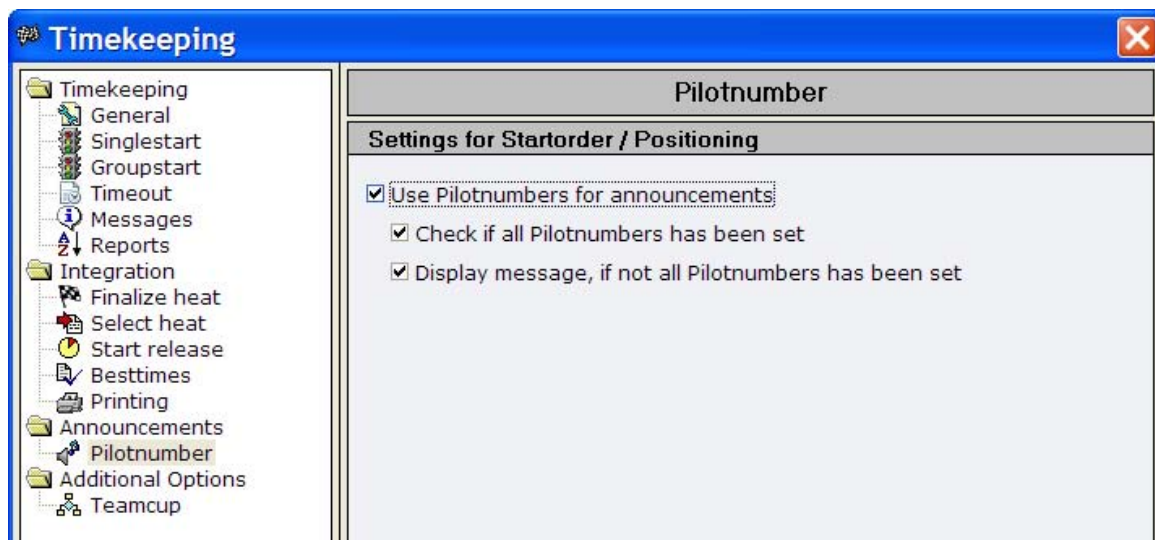

If you activate the „Automated printing handling“ you can select whether the results are printed automatically or not. If you do not activate this feature, RCM Ultimate is displaying the normal print dialog after each heat and you have to do the printing manually.

### 12.4.12 Announcements/Pilotnumber

Here you can select whether the announcements of RCM Ultimate are made with the pilotnumbers or not (if not, the announcements will be made with the car numbers). You can specify, if the program should check if all pilotnumbers has been set and if you see an error message if not all pilotnumbers have been set. We recommend to activate both options, cause otherwise the announcements are maybe irritating for the drivers.

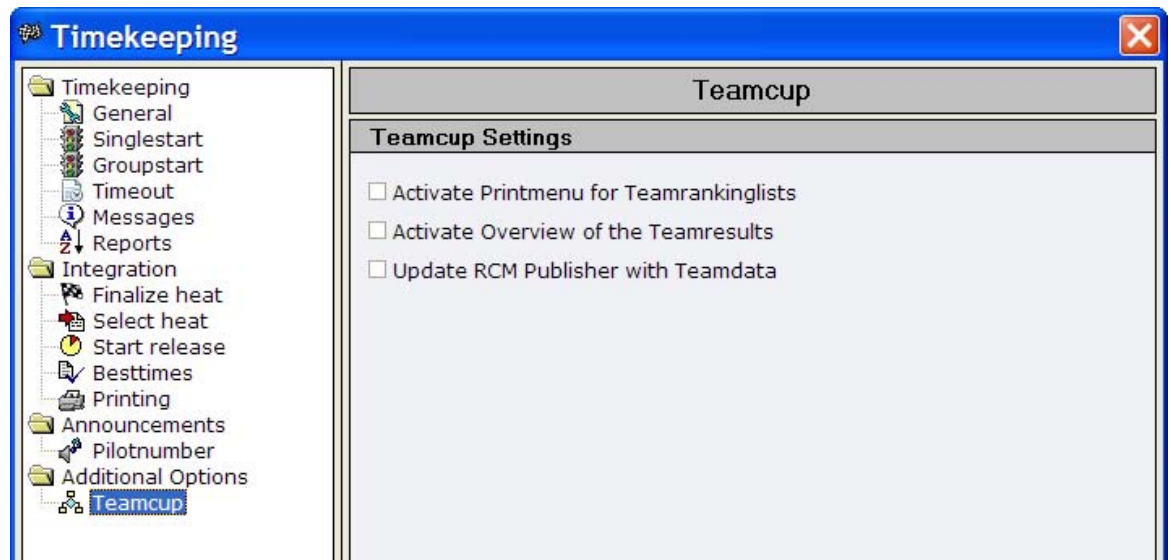

If you activate that driver numbers will be used, the driver numbers will also displayed in the arrangement of the heats for example.

### 12.4.13 Additional Options/Teamcup

Activate all functions if you want to run a teamcup. Besides of the normal results you can print an additional team rankinglist. It is necessary, that the team information are entered in the inventory date (teams and persons) to run a teamcup.

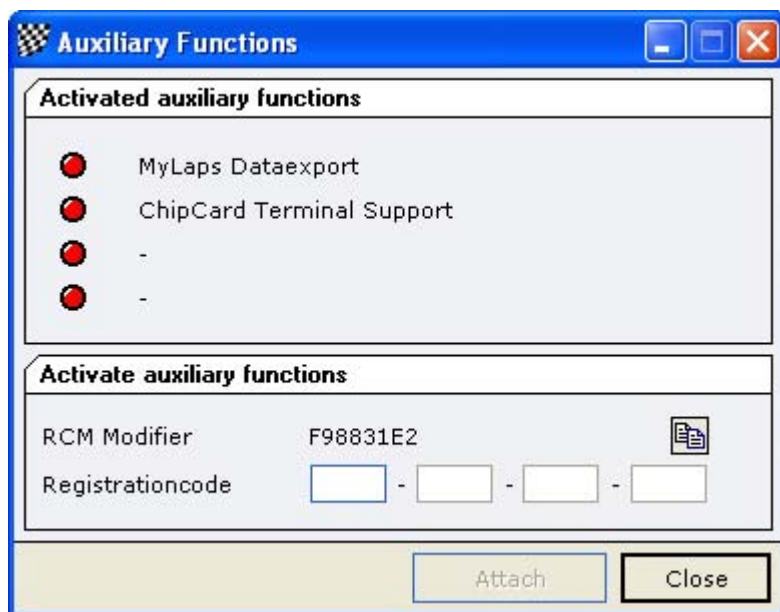

## 12.5 Auxiliary Functions

### 12.5.1 Mylaps

RCM Ultimate supports the connection to MyLaps of AMB in Holland. To be used, this connection must be registered. You can get the registration code from RC-Timing or you can order it by yourself in the internet if you have an appropriate contract.

It is necessary to have an ADSL-Connection to the internet to send the lap times from the personal transponders to the AMB server. If the MyLaps dataexport is activated, RCM Ultimate send the data automatically to the AMB server. A driver can login at home to the AMB Server (also the drivers needs an account from AMB) and he has access to his personal lap times.

### 12.5.2 ChipCard Terminal Support

RCM Ultimate supports the connection to a ChipCard Terminal. This must be registered, which can be done here. You can get further information of a ChipCard Terminal from RC-Timing.

## 13 Tools

The menu tools is offering the following functions. Beside of other these are::

Activate and inactivate a transponder set.

Remove Pilotnumbers.

An extensive search function

Delete the temporary transponders.

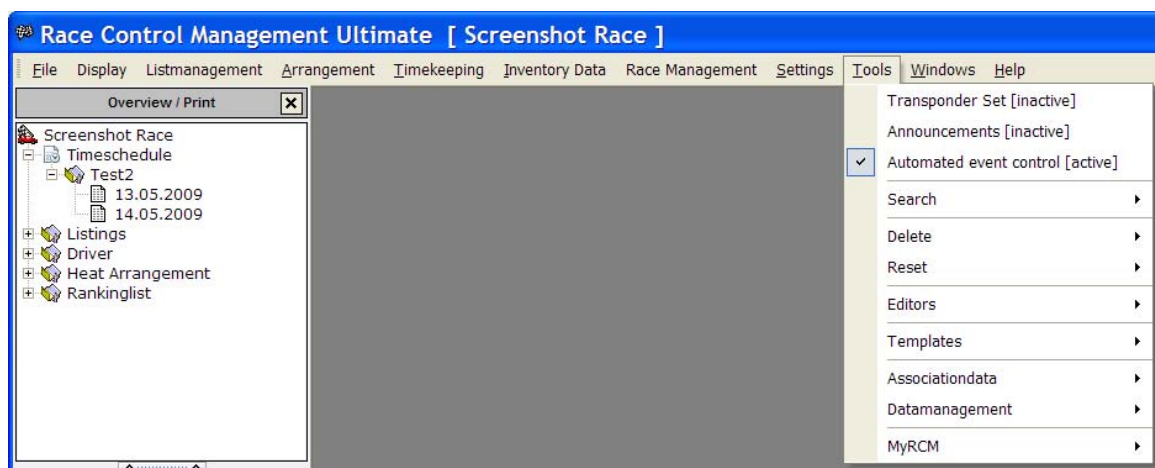

Reset of the skill levels.

Language editor for changing or translating the text of the program.

Template to make definitions for the layout of the reports.

Import and Export of federation data.

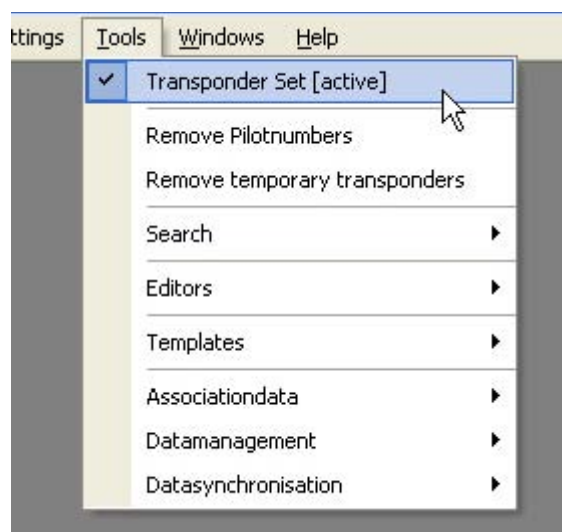

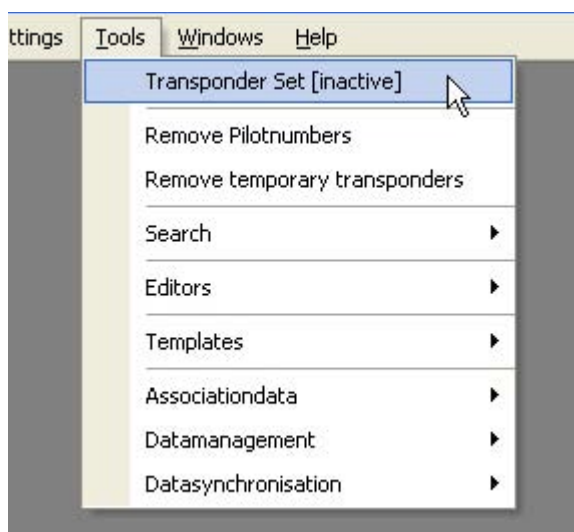

Import and Export of the data saved in the database of RCM Ultimate.

### 13.1 Transponder set

This menu item is added by the text [active] or [inactive].

Active: This setting uses the transponder set of the event. The transponder numbers 1 to 10 equate to car numbers 1 to 10. For example car number 1 will be counted with the transponder number registered in the transponder set to count car number 1. This setting is used, if you hand out the transponder for each heat and collect them back after the heat.

Inactive: This setting is used not using any transponder of your club or you hand out these transponders for a whole race day. In this case these transponders are handled

like personal transponders but should be registered as temporary transponder in the drivers data.

If you have recorded your hand out transponders in a transponder set and this transponder set is set to inactive RCM Ultimate recognize if a transponder is a regular personal transponder or if it is one of the hand out transponders. You see this in the transponder log file. A transponder from the transponder set will be marked with "club".

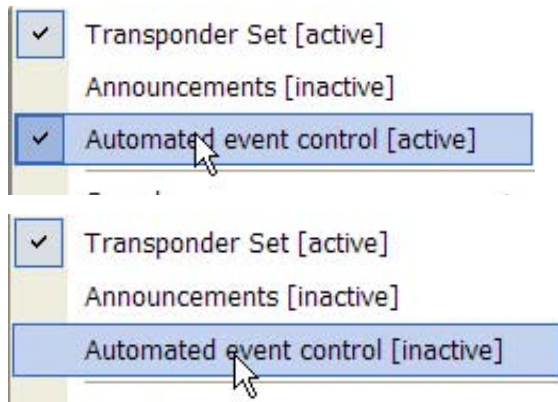

The status (active or inactive) can be changed just by clicking on the menu item transponder set.

## 13.2 Announcements [active]

Sometimes it happens, that the announcements should be activated or deactivated quite fast. This menu item is a toggle switch, this means, if the announcements are activated they will be deactivated by clicking on this item. Are the announcements deactivated they will be switched on by clicking on that menu item. Activated is shown in the menu by a preceding check mark.

## 13.3. Automated event control [active]

Sometimes it happens, that the automated event control should be activated or deactivated quite fast. This menu item is a toggle switch, this means, if the event control is activated it will be deactivated by clicking on this item. Is the event control deactivated it will be switched on by clicking on that menu item. Activated is shown in the menu by a preceding check mark.

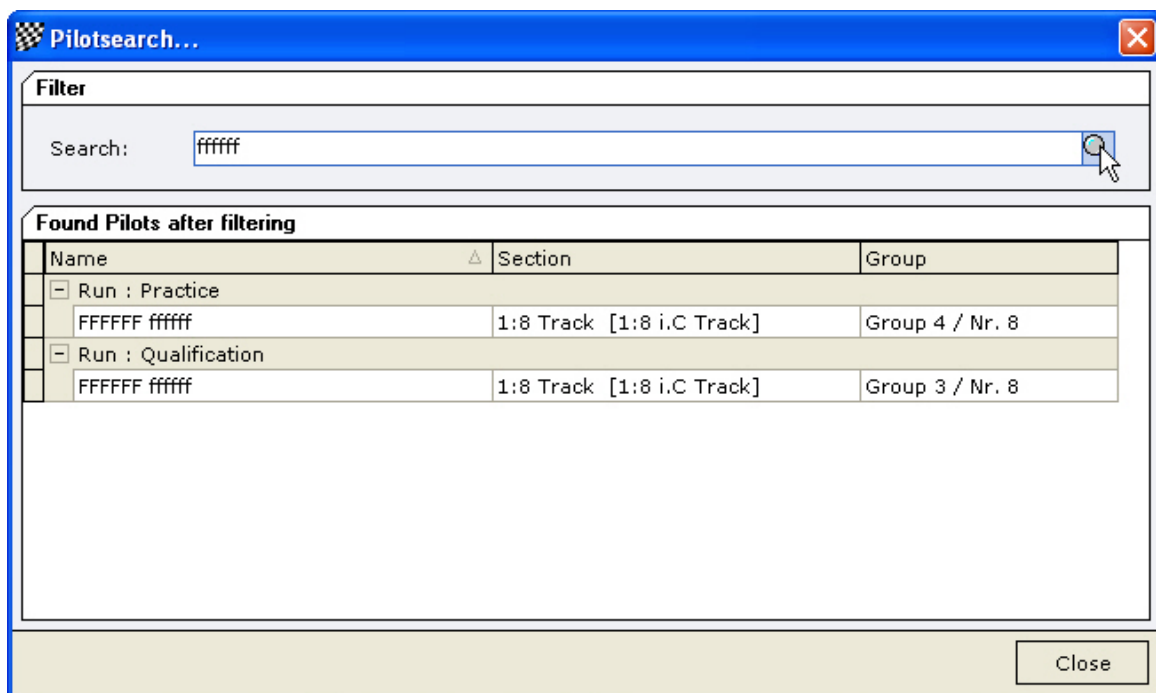

## 13.4 Search

With this function you can find quite fast several information. You can search for drivers, transponders and frequencies. This gives you the possibility to answer questions like “in which heat is the driver”, “to whom belongs a transponder” or “who other is using the frequency” very fast.

### 13.4.1 Pilot

Enter the name or a part of the name and click on the search button right of the input field. All drivers matching your input are listed in the lower part of the window.

### 13.4.2 Transponder

Enter the number or a part of the number and click on the search button right of the input field. The drivers using transponders matching your input are listed in the lower part of the window.

This is very usefull, if you are looking for a club transponder the driver has not brought back after the racing or if a car has not been collected at the technical inspection and it can be identified by a personal transponder.

**Transpondersearch...**

Driver with selected Transponder

Transponder Nr.  

Name	Section	Group	Transponder
<b>Run : Practice</b>			
HHHHHH hhhhhh	1:8 Track [1:8 i.C Track]	Group 3 / Nr. 1	1234565

<b>Run : Qualification</b>			
HHHHHH hhhhhh	1:8 Track [1:8 i.C Track]	Group 2 / Nr. 1	1234565

Close

### 13.4.3 Frequency

Enter the frequency or the channel number to check who is using this frequency. The frequency calculator automatically recognize the image frequencies which can cause interference too and should be avoided. The drivers using the frequency are listed in the lower part of the window. You can see, if two drivers can cause interference problems to each other.

**Frequency Calculator**

Frequency conversion

Frequency / Channel  [MHz]

Upper Mirror Frequency: 27.470 MHz

Lower Mirror Frequency: 26.560 MHz

Close

## 13.5 Delete

With this function you can delete the pilotnumbers and the temporary transponders.

### 13.5.1 Remove Pilotnumbers

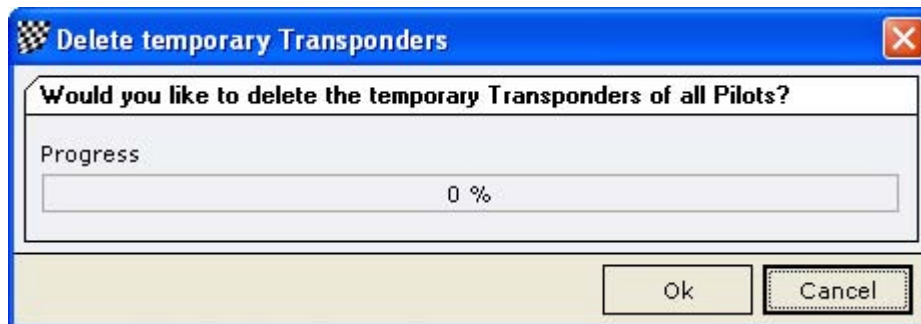

When you arrange the heats you can create pilotnumbers, which can be used for an easy identification of the drivers. This function removes all the pilotnumbers after an event. This gives you the possibility to create new pilotnumbers at the next event.

The numbers are remove by clicking on OK when you will be asked if you would like to delete the pilotnumbers of all pilots.

### 13.5.2 Remove temporary transponder

When you use the Transponder Set [inactive] then all used transponders from the set are registered as temporary transponder. In the evening after the race day you will collect all these transponders for recharging and to prepare them for the next race day. To clean up now the configuration you select the menu item remove temporary transponders to get the fields in the personal data empty.

The deleting process is controlled by a progress bar. You should not interrupt this process.

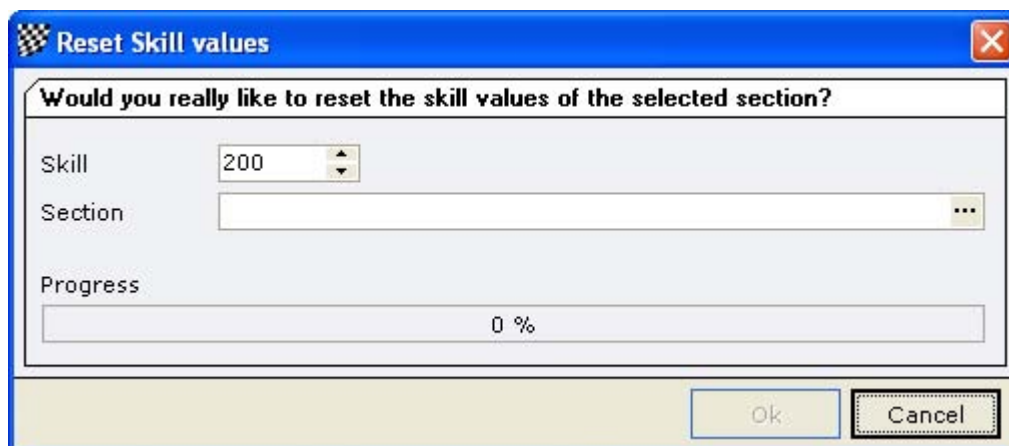

## 13.6 Reset

With this function you can reset the skill values and the skill levels.

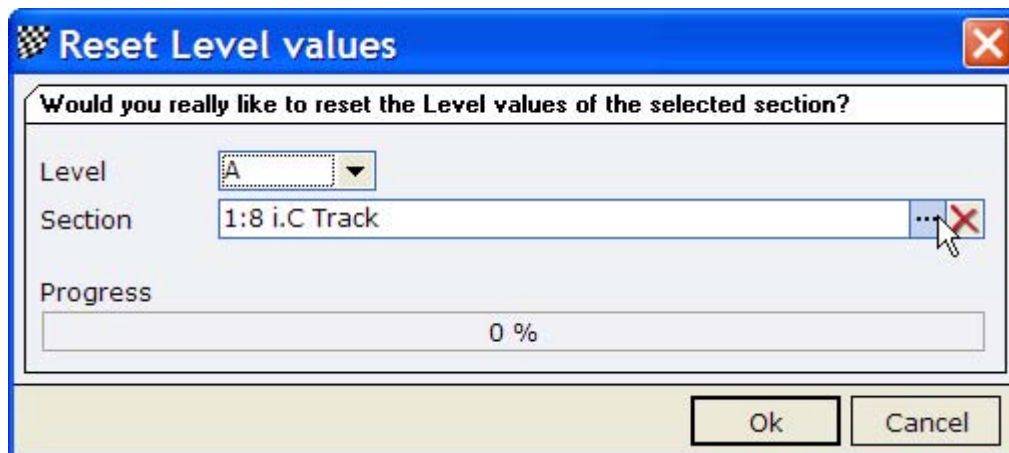

### 13.6.1 Reset skill values

This function enables you to reset all skill values of a specified section to specific value. You have to enter the value for the reset of all drivers and the section. A bar shows the progress of this function to you.

### 13.6.2 Reset Level Values

This function enables you to reset all level values of a specified section to specific value. You have to enter the value for the reset of all drivers and the section. A bar shows the progress of this function to you.

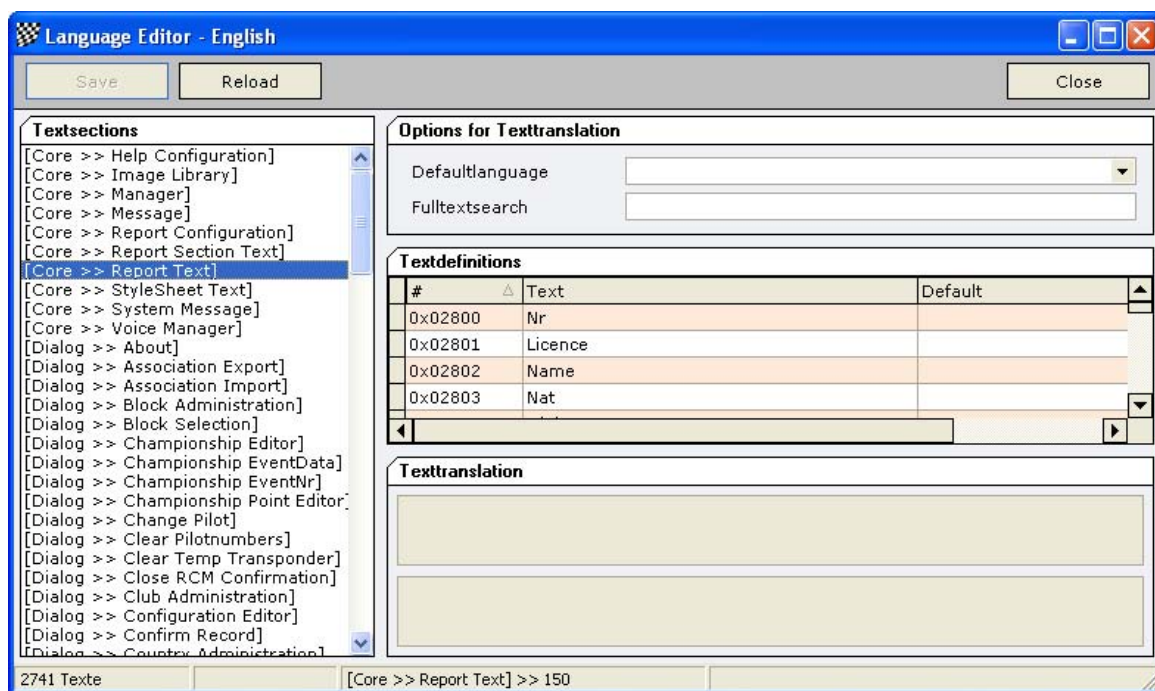

## 13.7 Editors

Here you can change the text RCM Ultimate is using as well as the voice announcements.

### 13.7.1 Translations

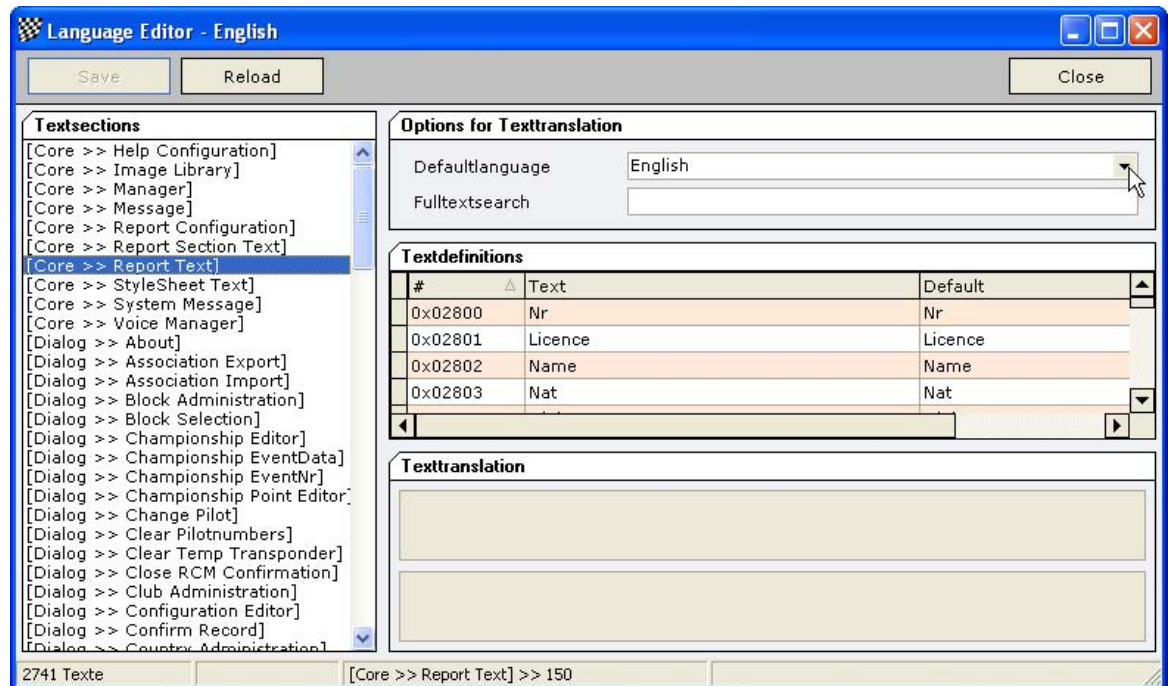

The Language editor allows you to change all the text used by RCM Ultimate. Furthermore it is possible to generate new language sets and to translate all the text into a desired language. If the language editor is started approx. 1900 text definitions have to be loaded. This takes a little bit of time.

The windows of the language editor shows you in the left column a menu ordered to topics which are based on the use of windows and/or functions. If one of these topics is selected, you see in the right column a table of all the text definitions

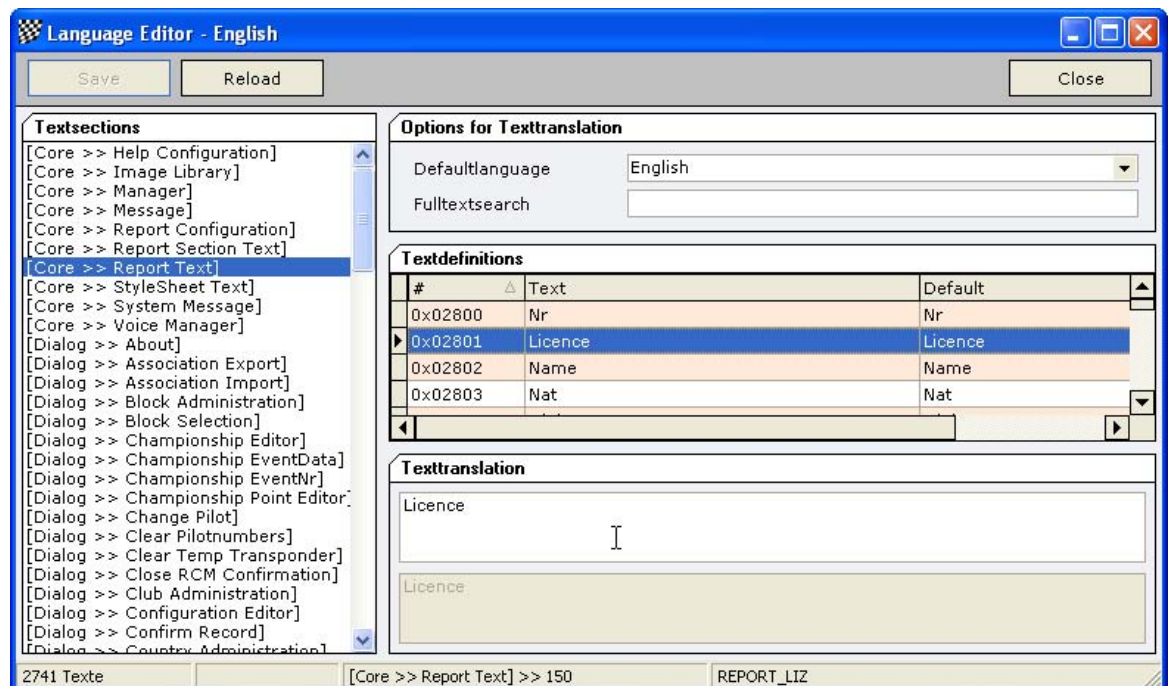

related to this topic. On top of the right column you can define a default language. This will be active, when you select another topic on the left side.

### 13.7.2 Change a text

After having selected a topic in the left column you have to mark the text in the right column. You can change the text below in the field Texttranslation. Please note, that the changes will only be effective, when you finish by clicking the Save-button.

With Fulltextsearch you can search the whole language database for a specific text. This will help you to correct for example a word with a type mistake you have found. Please note again, that you have to save your work before you mark another topic in the left column or before you close this window.

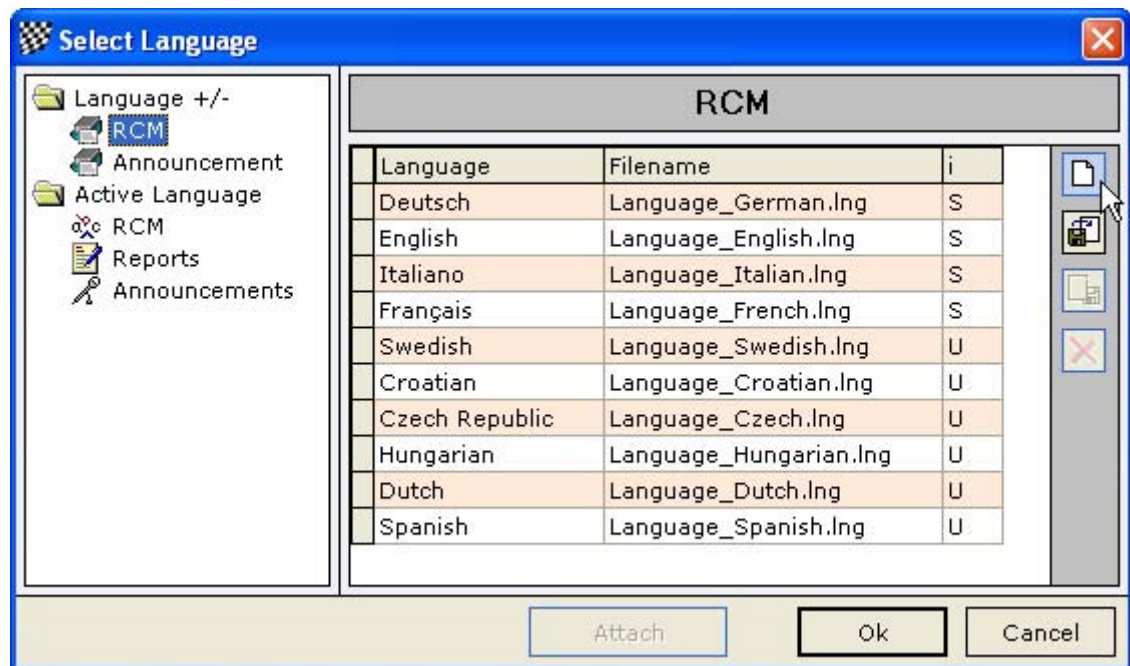

### 13.7.3 Create a new language set

The language editor can be used to create a new language set. The name of the new language must be created in the menu Configuration/Language.

Here you select Language +/- . In the right column you see all languages available with further information, which you find in the table in the last column (under heading "I"): "S" means Standard and "U" means User. The standard languages have been delivered with the software. We are not able to deliver all User based languages. This depends on contracts with the creator of these language sets. Some of the Language Sets we have bought, other will be offered by the creators. If you have created a new language set, please contact us.

The buttons on the right side of the windows allows you to generate a new language set, to import a language set, to export a language set and to delete a language set.

New language set: Opens a window in which you have to type in the new name of the Language you want to create. You have only to type in the name in the Language field. The filename will be automatically created and should not be changed. For the name of the language please use the English description. When you confirm your input with Ok, a new set based on the English set will be created. Now you can translate all text with the language editor.

Import language file: You can import language files for RCM Ultimate from other creators. If this new language is not yet available in the application, you have first to create a new language. Otherwise this option synchronise the new data with the existing language file. Missing text will be replaced by the English text. When you import a language file a logfile will be created showing you a detailed description of all operations done by the system.

Export a language file: With this function you can export a marked language to a language file.

Delete a language: With this button only the entry in the tables of the application is removed. The language file by itself will not be deleted.

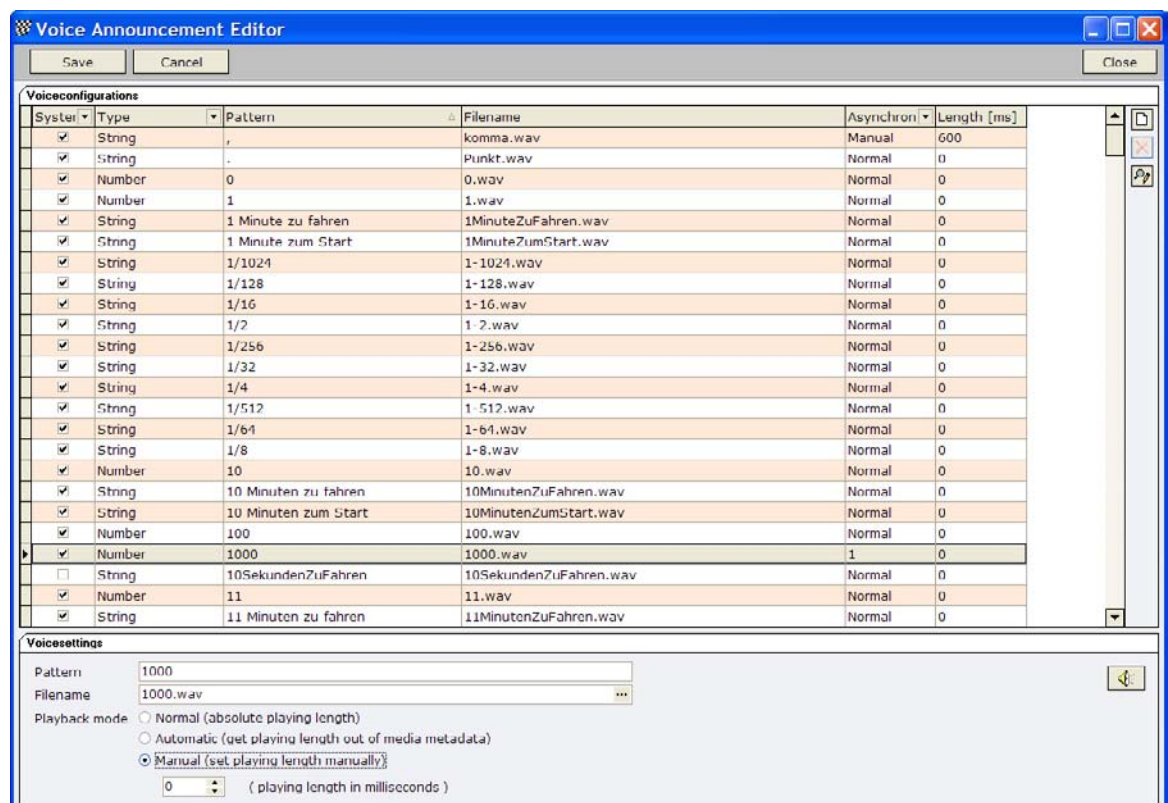

If you want to create a new language set, you have to create a new language.

After that, you have to make sure, that RCM Ultimate uses this language (Settings/ Language/RCM Language). Cause the new set is based on the English Set, all text is now in English. The next step is to translate all text with the language editor. For a better understanding of all text we recommend, that you use the default-setting of the language editor to have the text also displayed in that language you are familiar. Please note again, that you have to save (with the Save button) all your changes before you select another topic in the left column of the language editor.

### 13.7.4 Announcement

With the voice editor you can define the different soundfiles used for the announcements. For you as a user there is only one function of interest: Very often sound files play longer as needed for the voice response. With the setting of the playback mode you can limit the play time. When using the manual mode, you can set the time in ms. Please note: if you limit the play time too much it is possible that you hear nothing.

The buttons on the right side of the windows are used to add soundfiles to the configuration or to delete one.

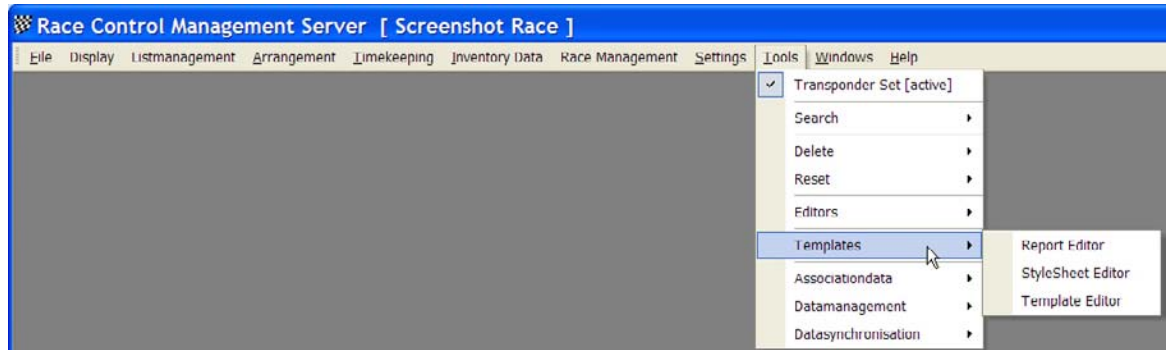

## 13.8 Templates

In this menu there are three tools for the design of the reports available:

Report Editor: Configuration of the page layout

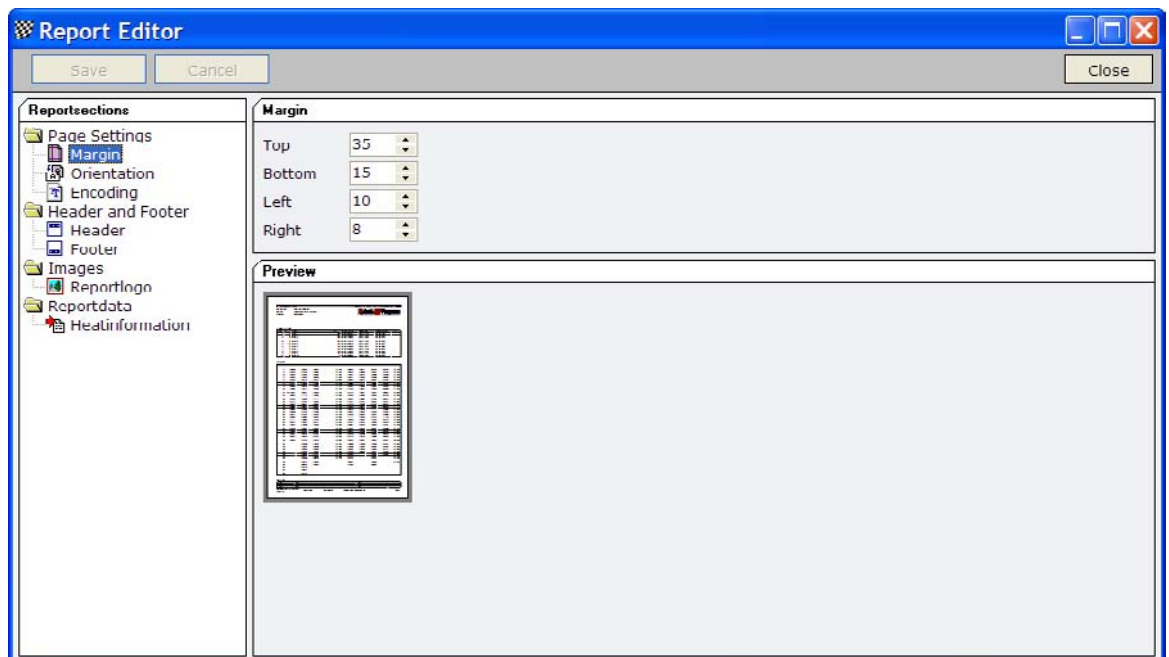

Style Sheet Editor: Configuration of frames, Typefaces and colours.

Template Editor: Configuration and placement of the content of a report.

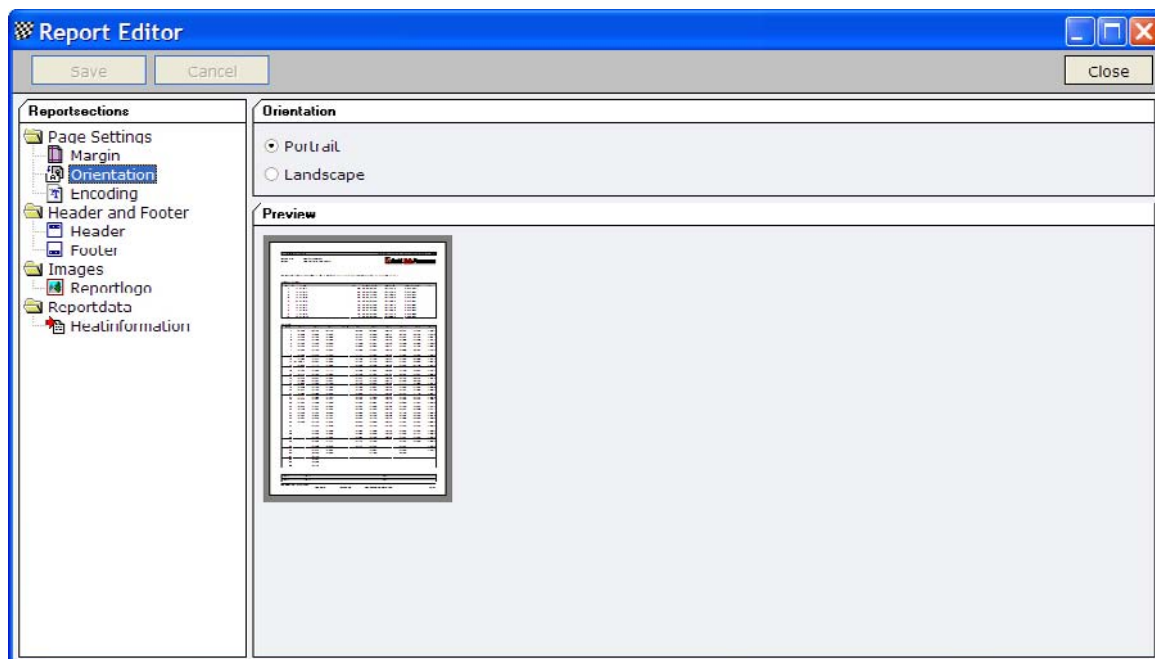

### 13.8.1 Report Editor

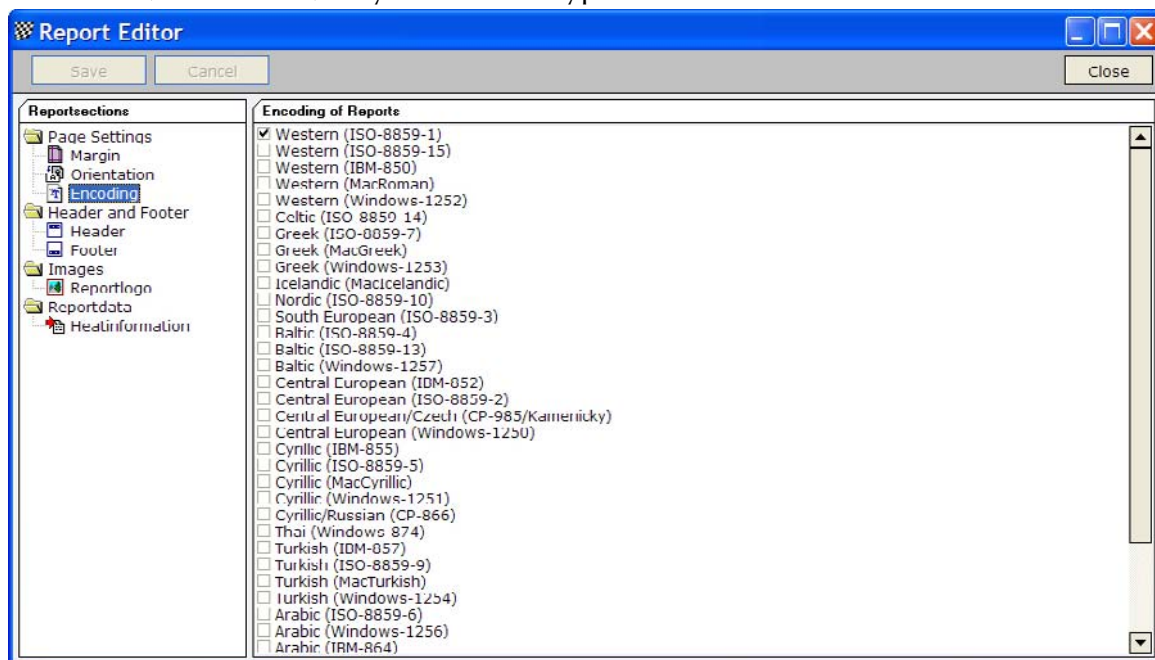

Here you can configure the page layout of the reports. With page Settings/Margins you define the margins, on top for the header line and on bottom for the footer as well as the left and right margin.

Orientation: Here you select whether to print in portrait or landscape orientation.  
Header: This is not yet supported in RCM Ultimate.

Encoding: Windows supports different typefaces with partly different encoding.  
This is quite important if you use non-latin typefaces. Leave the default setting of  
"Western (ISO 8859-1)" if you use latin typefaces.

Header: here you can define the information printed in the headline of the reports for the races.

Footer: The footer includes information about the race director, the time keeper as well as the date and time of the print. The names have to be entered at the event configuration. Here you should only make the definition whether this information is printed or not.

You can add text using the memo pad bottom on the right side of the window. You delete entries with the X-button. Please note, that the bottom margin is high enough if you are using a footer.

Images/Reportlogo: In the header you can print a picture. Normally you are using the logo of your club. The picture should not be bigger than 4 Kbyte otherwise it will not be send to RCM Publisher. If you want to use a picture of a better resolution, it must be saved in the RCM Publisher separately.

Reportdata/Heatinformation: You can select which data is printed on the reports.

## 13.8.2 Style Sheet Editor

Here the typefaces, the color, the background of the header and the footer as well as the frames and the design of the tables can be defined for all reports.

You can set the different sections of the reports independently. Please note, that the templates of all reports are listed in the left column of the window, but these templates are all based on the same style sheet. Settings you are changing are affecting all reports using this Standard RCM Stylesheet. But you can generate an extended stylesheet for each report. Just click right on the name of the report and select from the menu "extended stylesheet". RCM Ultimate now generates an extra stylesheet only use for this report. This stylesheet is used completely independent from the Standard RCM Stylesheet.

Select in the left column the name of the report you want to edit. In the top line of the right column you see the name of the stylesheet.

In the middle column the sections of the stylesheet are listed. Select the section you want to change and in the left column you can change the formatting. In details you can select the following sections:

Header (eventname and eventdata)

Infoline (groupinfo)

Reportdata (heading, border, Headline and data lines)

Footer (footer)

Special tables (table data)

Batch (main border)

Each detail can be defined in the typeface, the color, the style and the size.

Additional you can define a border, the background color, the text indentation and the line height.

For example, if you want to use a bigger typeface for the name of the organiser, the date and the track, just select in the column stylesheets header/eventdata. In the right column you enter 10 for fontsize, bold for the fontstyle and 11 for the lineheight. If you now print the report, you will see the details of the event bigger (depending on the change you have to generate the report again befor you can see the changes).

After finishing all changes you have to save your work before you close the window.

### 13.8.3 Template Editor

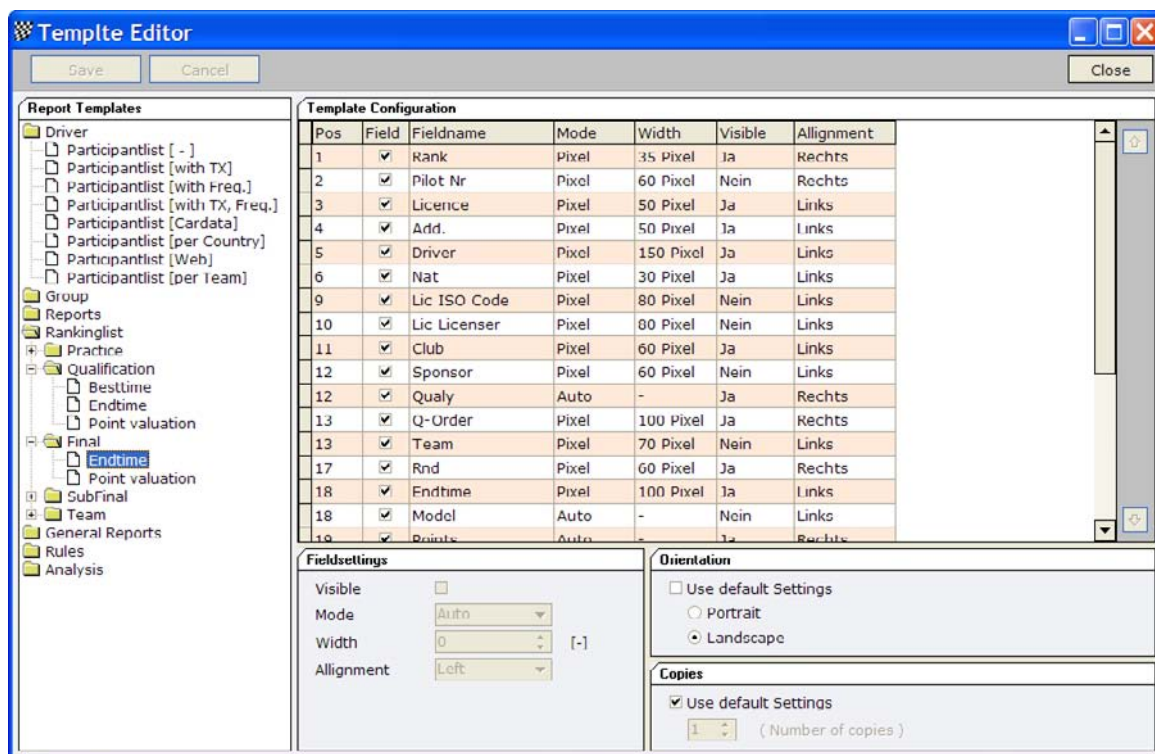

To define the content of all reports you use the Template Editor. At the left side you see all available reports in RCM Ultimate. All reports corresponds to the menu item display overview/print.

At the right side you see all available fields of the selected report. All fields can be set individually (field settings: visible or not, mode for length values and alignment), and the field can be positioned with the up and down arrows at the right border side.

Fieldsettings: In Auto mode there is no value to set. The fields have the requested length. In Pixel mode the value have a calculable length. If the field is to short a line feed breaks the text. You have to try to find an optimum but the Pixel mode is the best way for a proper report adjustment. In % mode you use percentage values. The text will use e.g. 30% of the line at the right side from the end of the last word at the left side.

Print Orientation: Some reports have quite many columns then you should switch to the Landscape setting. Inactivate "Use default settings" and switch on landscape. Below in the right column you can set the number of copies which are printed of this report. The value set here is used in all printing menus.

Remark: In some cases the column header of tables are very long. You can adjust this text in the language editor.

After changes in a report you have to save the work. The effects can be immediately checked by opening the corresponding report.

Using the Sub- and Mainfinal-Mode the template "subfinale-endtime" will be used. If you activate the field "history" in this template, the results of the lower finals of each driver will be printed too.

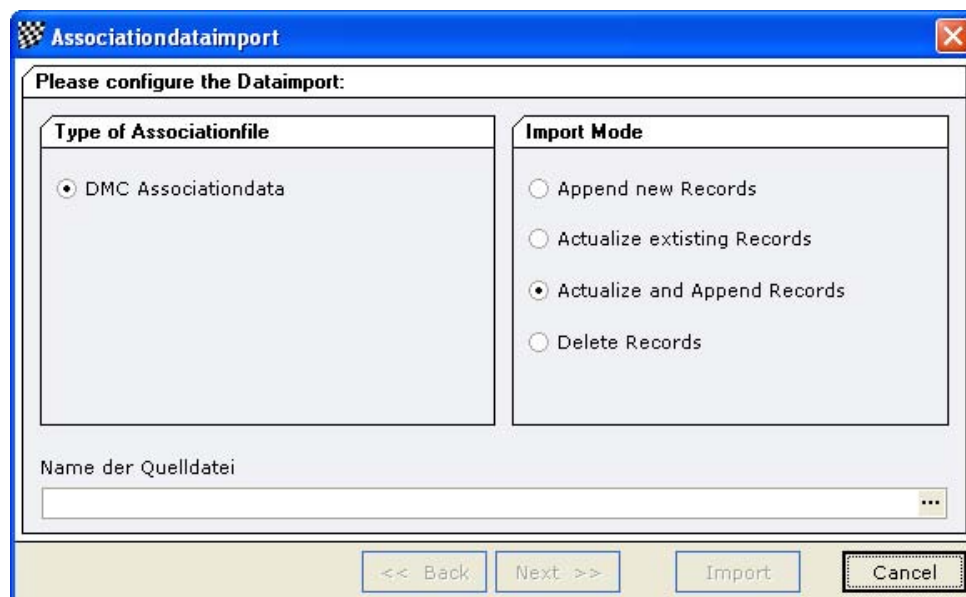

## 13.9 Associationdata

Some national federations provides the race organizers with the data of the licensed drivers in a special format. Also some federations request to get the final results of a championship event as data file from a race organizers to process the data in their own administration system. At the moment, RCM Ultimates supports the data from the national federations DMC and SRCCA.

### 13.9.1 Import

The drivers data can be imported. The data files can mostly be downloaded from the websites of the federations ([www.dmc-online.com](http://www.dmc-online.com), [www.srcca.ch](http://www.srcca.ch)). The import is only possible if no event is loaded.

In the right column of the window you can define how RCM Ultimate handles the import data:

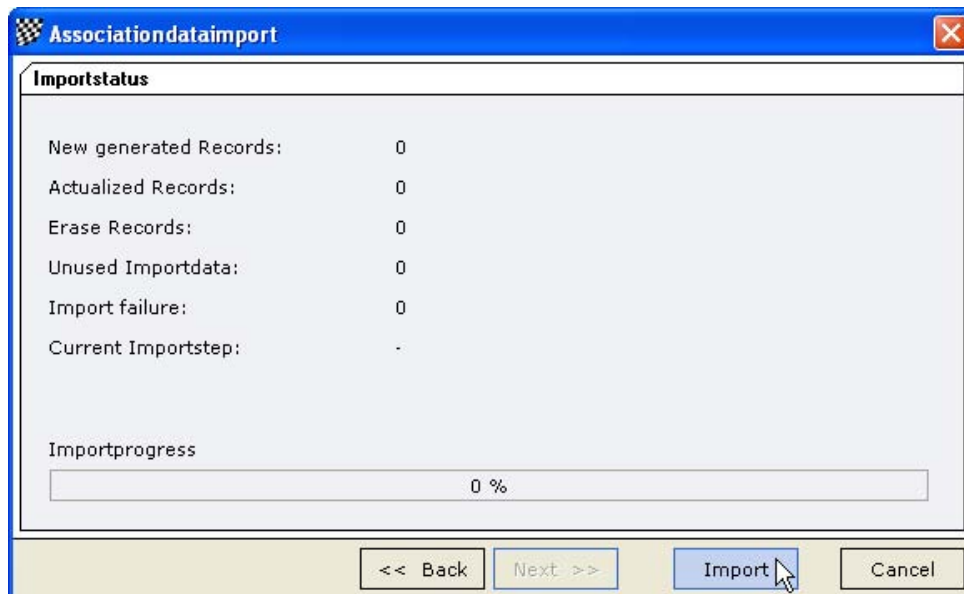

**Append new record:** Only new data records will be used and imported. Please note, that new drivers will be set to inactive first.

**Actualize existing records:** All data records (active and inactive) found by RCM Ultimate are checked and updated with new information.

**Actualize and Append Records:** This is mostly used and is a combination of both previous described functions.

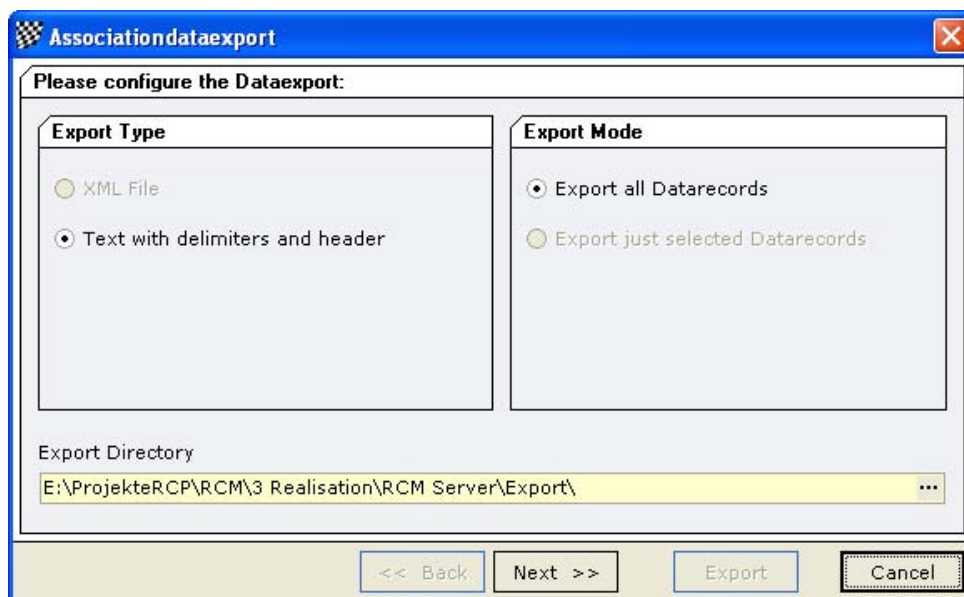

**Delete records:** The import file contains only drivers which should be removed. If a driver is found, the driver is not physical deleted, it is set to inactive. A driver already being inactive will not be changed in his status.

You have to enter the import file in the input field at the bottom of the window (if you click on the three point button, you can search the import file. Clicking on next opens a new window where you start the import by clicking on Import).

## 13.9.2 Export

For now, only the export of the final ranking list for the member administration of the German Federation DMC is realized in RCM Ultimate. The format of this file is defined by the DMC and there are no further options available.

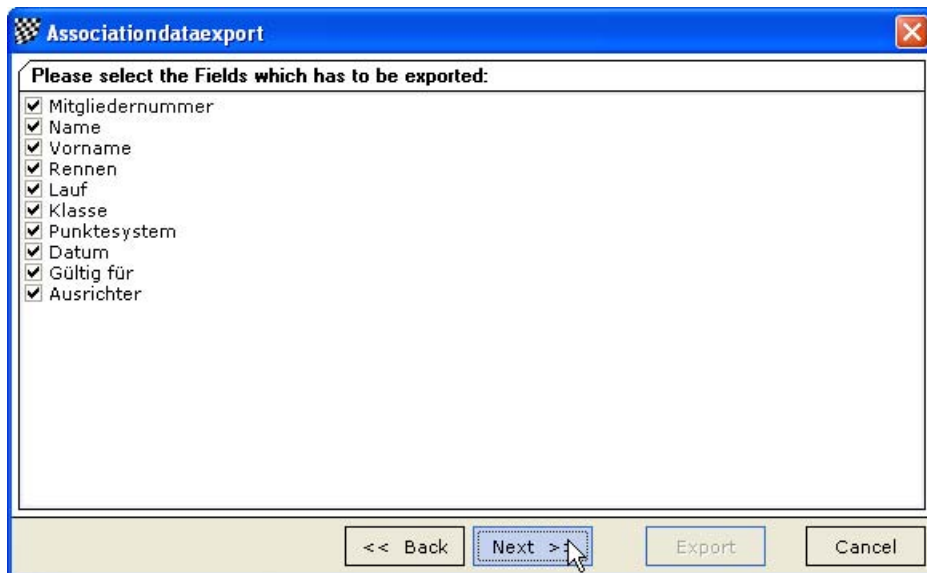

The file (text with delimiters and header) will be saved in the folder RCM Ultimate\Export. But, clicking on the three point button and the end of the input field for the export directory, you can choose the folder.

Next leads you to the next window. Here you can only select "DMC Finalrankinglist".

Clicking on Next opens another window where you can define the fields to export. Here you should change nothing.

Just click on Next and start the export in the next window by clicking on Export.

After a successful export you see the message "Data Export complete" and you can close the window.

## 13.10 Datamanagement

With this menu item you can import and export data. We recommend to make a backup of the complete database of RCM Ultimate before you start an import. If the import was wrong configured and maybe some data have been entered in wrong fields, you can go back to the old database.

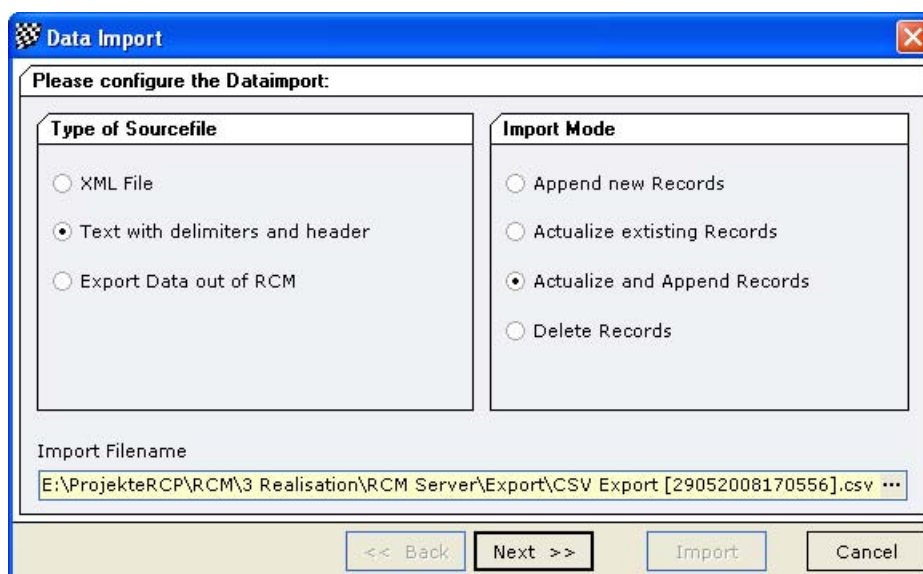

### 13.10.1 Import.

The import is only available if no event is loaded. The import is possible for different file types.

**XML File:** This importscheme is not yet implemented. This function will be available, when the datatransfer via Internet is realised. The database used in RCM Ultimate is a flat oriented relational database you can access with SQL statements of XML code.

**Text with delimiters and header:** Selecting this option you can import Excel-sheets with some special requirements: The Excel sheet must have a header line in the first row. The excel sheet should not have any empty lines and must be saved in CSV-format. Only if theses conditions are respected an import is possible. Special content of the csv-file is imported the following way: If a field is empty the content of the database of RCM Ultimate is not changed. If the filed contains "-" (minus sign) then the content in the database is deleted (the field is empty after the import).

Select the import file in the open file dialog.

In the right column of the window you can define how RCM Ultimate handles the import data:

Append new record: Only new data records will be used and imported. Please note, that new drivers will be set to inactive first.

Actualize existing records: All data records (active and inactive) found by RCM Ultimate are checked and updated with new information.

Actualize and Append Records: This is mostly used and is a combination of both previous described functions.

Delete records: The import file contains only drivers which should be removed. If a driver is found, the driver is not physical deleted, it is set to inactive. A driver already being inactive will not be changed in his status.

Next leads you to the next window Where you have to select the table of the inventory data to which the file correspond.

**Data Import**

Please select the Destination Table:

**Import master data**

- ☒ Persons
- ☐ Pilots (Sectionassignment)
- ☐ Persons and Pilots
- ☐ Clubs
- ☐ Teams
- ☐ Sections
- ☐ Organisator
- ☐ Tracks
- ☐ Country
- ☐ Frequency
- ☐ Associations

**Import event data**

- ☐ Driverlist

<< Back   **Next >>**   Import   Cancel

Clicking on Next opens another window. In the left column you see the names of the fields configured in the import file. The right column shows you the fields of the selected table of the inventory data.

**Data Import**

Please create the necessary Fieldmatchings:

Datafields of Sourcefile		Fieldmatching to destination Table	
Pos	Name	Destination field	Source field
1	Initial	Initial	
2	Name	Name	
3	Adresse	Address	
4	Ort	Location

Using the magic stick will assign the fields automatic recognized by the program. Other fields can be assigned by marking these in the left and right column and clicking on right arrow button. Using the left arrow button will delete an assignment. An assignment will be shown in the right column in the column source field.

**Data Import**

Please create the necessary Fieldmatchings:

Datafields of Sourcefile	
Pos	Name
1	Kontaktperson
2	Land

Fieldmatching to destination Table

<< Back   Next >>   Import   Cancel

Export data out of RCM: At your race track you have exported the data of your event from RCM Ultimate. With this option these data can be imported to another RCM

Ultimate system. First you have to enter the filename in the import filename dialog. In the right column of the window you can define how RCM Ultimate handles the import data.

Append new record: Only new data records will be used and imported. Please note, that new drivers will be set to inactive first.

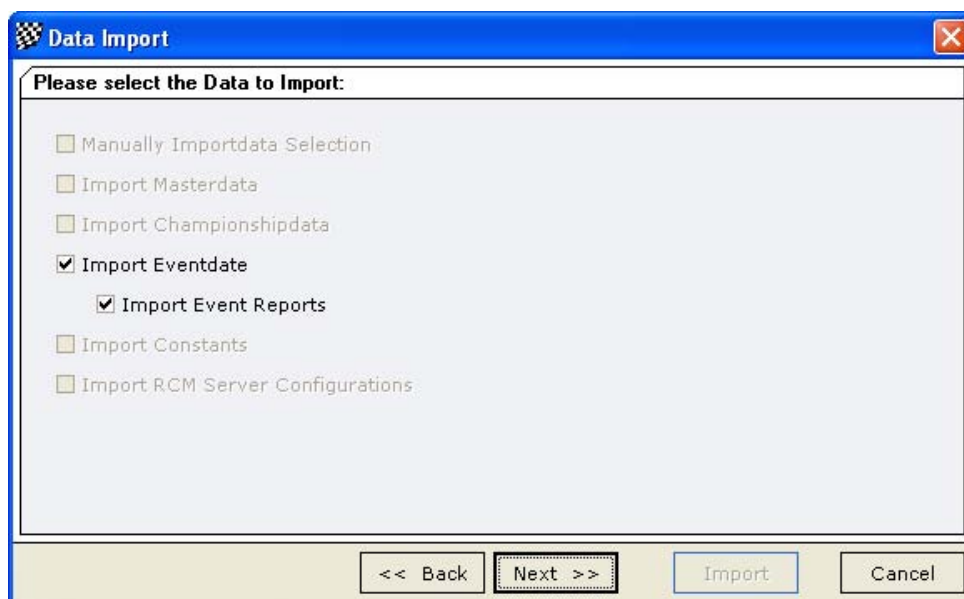

Actualize existing records: All data records (active and inactive) found by RCM Ultimate are checked and updated with new information.

Actualize and Append Records: This is mostly used and is a combination of both previous described functions.

Delete records: The import file contains only drivers which should be removed.

If a driver is found, the driver is not physical deleted, it is set to inactive. A driver already being inactive will not be changed in his status.

Clicking on Next opens a new window showing you the content of the import file.

Usually you do not change here any selections. This is valid if you have exported the data by yourself and you are sure to import it into the same version of RCM; Server they have been exported. If not or if the file comes from an another source,

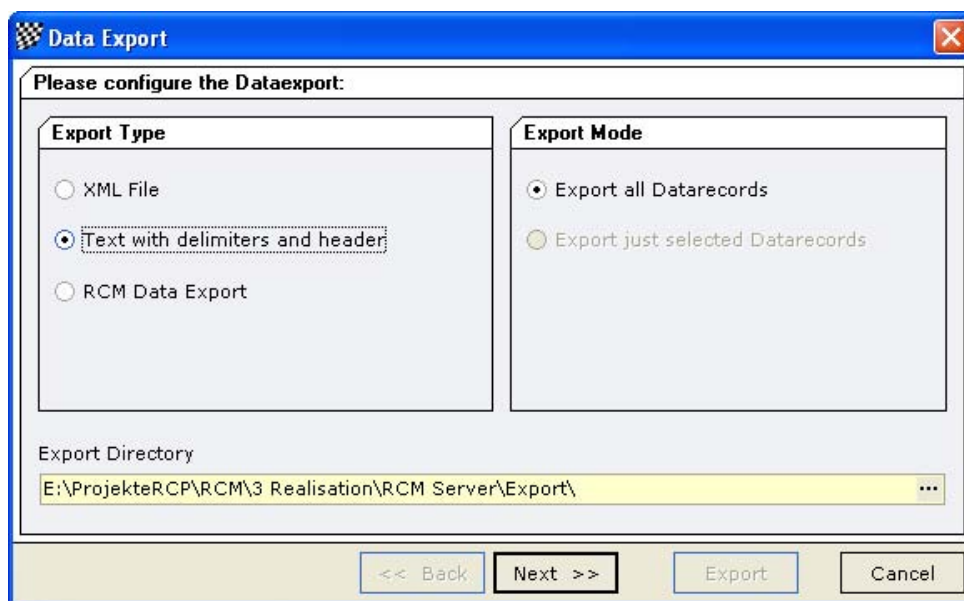

we recommend not to import the RCM Ultimate Configurations. Otherwise your special settings of RCM Ultimate will be overwritten.

With clicking on Next you go to the next window. Here you start the import by clicking in Import. The import is shown by a progress bar. If import errors occur these will be written in the logfile. This logfile can be found in the folder RCM Ultimate\Logfile.

### 13.10.2 Export

After an event is finished you can export the data to import these at home in another RCM Ultimate system or to give it to another user. The export can also be used as a backup system. Further on, you can export data in a text file with delimiters and header (csv file). These files for example can be opened in Microsoft Excel.

Text with delimiters and header: With this export type a csv file will be written. Clicking on next opens another window. Here you can select the data to export.

**Data Export**

Please select the Data to export:

- ☐ Persons
- ☐ Pilots (Sectionassignment)
- ☐ Persons and Pilots
- ☒ Clubs
- ☐ Teams
- ☐ Sections
- ☐ Driverlist
- ☐ Organisator
- ☐ Tracks
- ☐ Country
- ☐ Frequency
- ☐ Associations

<< Back   Next >>   Export   Cancel

Clicking on next opens a new window where you can select the fields to export.

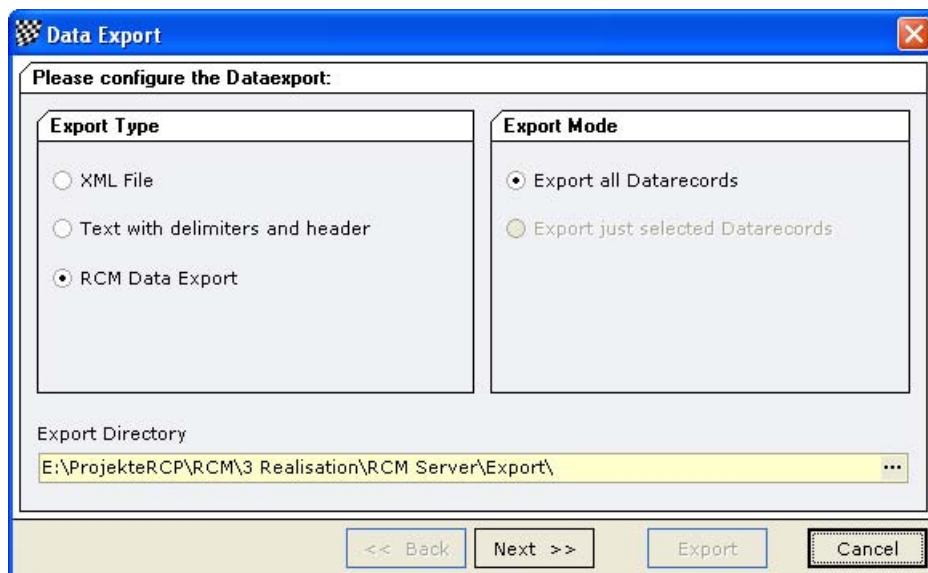

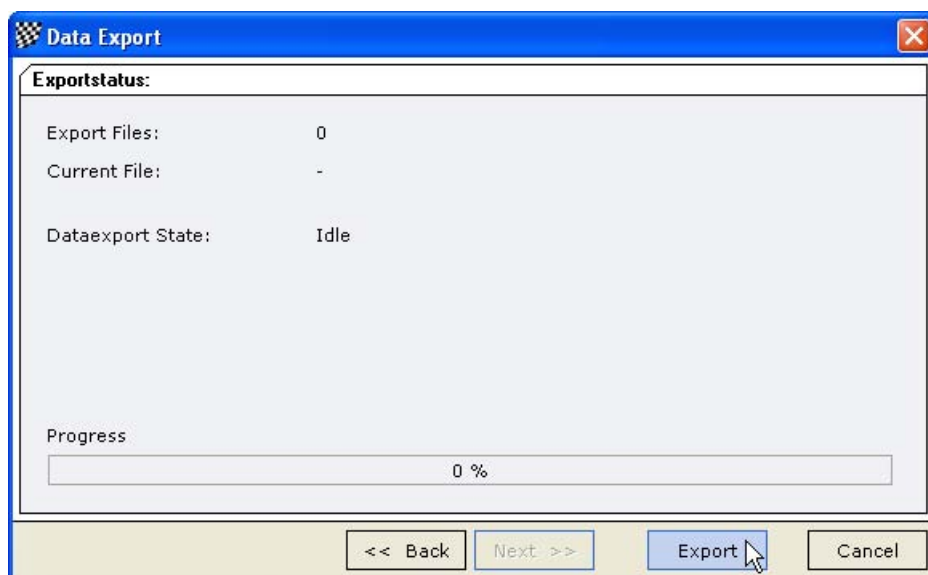

**Data Export**

Please select the Fields which has to be exported:

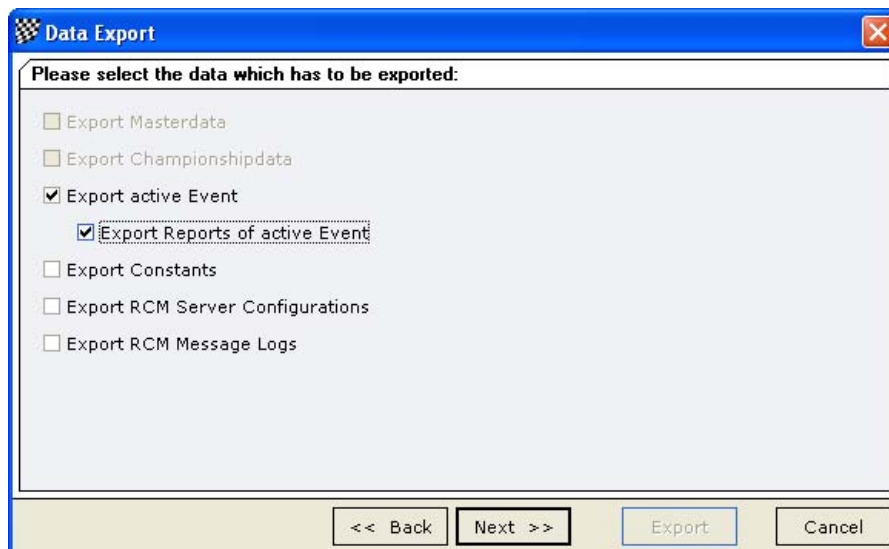

- ☒ Initial
- ☒ Name
- ☒ Address
- ☒ Location
- ☒ Contact
- ☒ Phone
- ☒ EMail
- ☒ Web Address
- ☒ Country

<< Back   Next >>   Export   Cancel

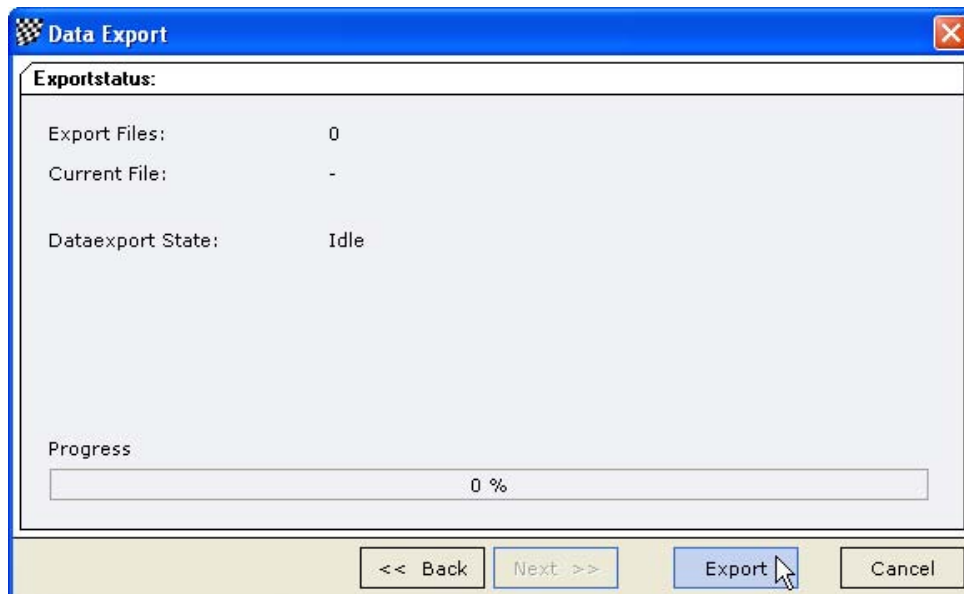

Next leads you to the final window. Clicking on the export button will start the export.

RCM Data Export: To export data you should at least select Export active event with the option Export Reports of active event.

Constants and Configuration should only be selected if you really want to have the same data at home as on the racetrack. It is very important, that you use the same version of RCM Ultimate or RCM Light at home you use at the racetrack. Masterdata and Championshipdata can only be exported individual. If you want to export theses data together with the data of the active event, you have to make several export operations. At home you have to import all these data files.

With Next you go to the final window. Here you start the export by clicking on the Export button.  
All export files will be saved in the folder RCM Ultimate\export.

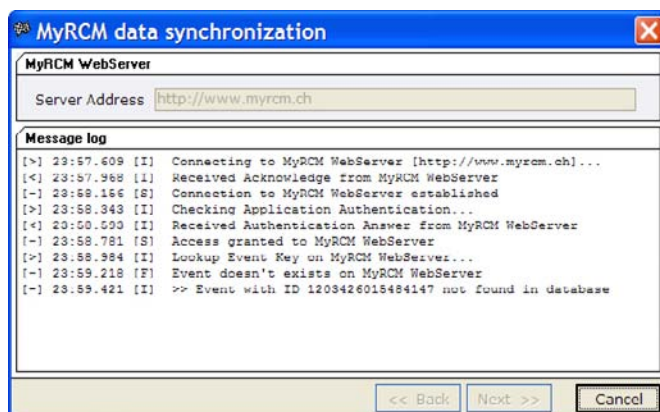

### 13.10.3 Dataexport to MyLaps

This function is only available if you have registered to MyLaps in Settings/auxiliary functions. Here you start the data transmission to the MyLaps server in Holland.

## 13.11 MyRCM

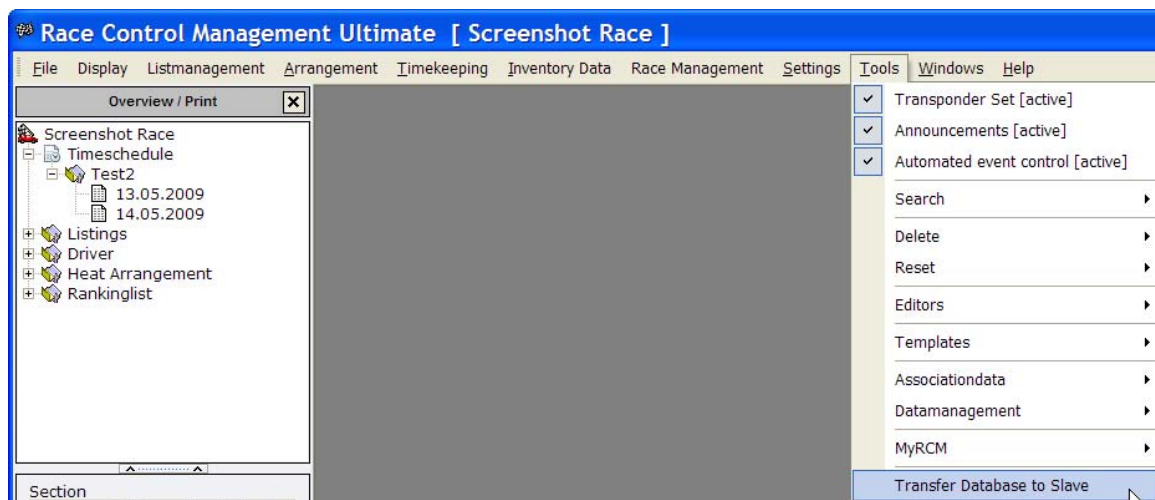

### 13.11.1 Data-Synch Down (Server > RCM)

With this function the registration list from MyRCM can be imported. The program searches the list on MyRCM and finally you can decide whether to import it or not. Besides of this function you can download the registrations as a CSV-file as already known.

### 13.12 Transfer Database to slave (only visible on Master when a master/slave connection exists)

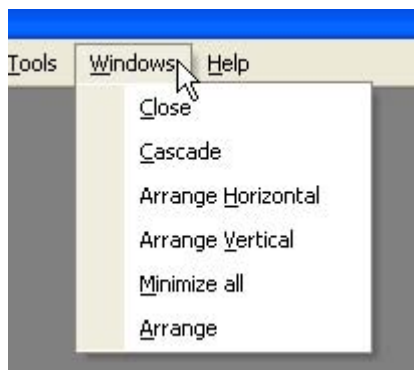

By clicking on that menu item, the database of the loaded event will be transferred to the slave (without the data of the timekeeping). This takes some time. Please note, that all other event-data in the database of the slave will be deleted.

## 14 Windows

The options of Microsoft Windows for the arrangement of windows are fully supported by RCM Ultimate. If you have more than one window opened you can arrange the windows just with a mouse click.

## 15 Help

In the menu help you find the user manual and information to the software release.

### 15.1 RCM Help

The integrated help menu explains all functions of the RCM Ultimate. The content is identically to this user manual.

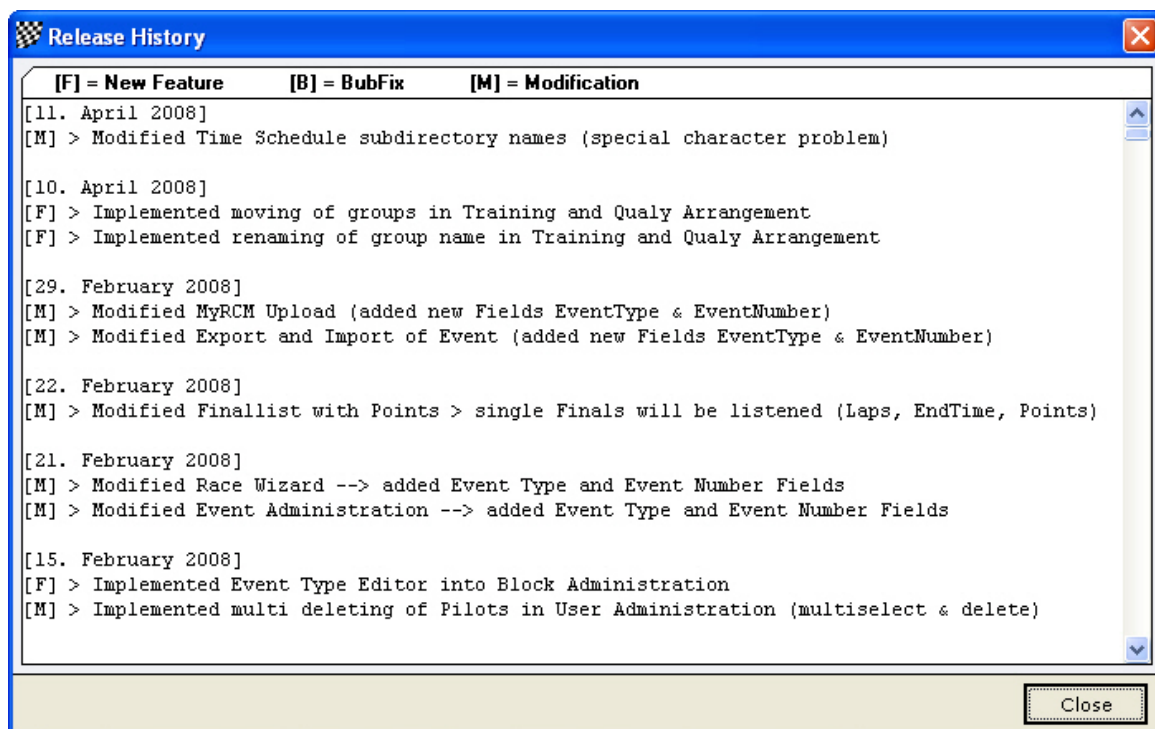

If you have a window open and you need help, just press the F1 key. The help section for this specific window will be opened.

The integrated help is available in English and German, If you have selected another language than German, the help is always in English.

## 15.2 Release history

The release history is a text file with comments to all changes/developments have been made for this application. The single entries are marked with letters: [M] = modification, [B] = bug fixing and [F]= new function.

When you get a new version we recommend that you read the release history to be informed on the news of RCM Ultimate.

## 15.3 Software Update

If your computer is connected with the internet, you can easy search for new releases of RCM Ultimate.

You can enter the server-address and you can select whether the update file should be deleted after the installation or not. If you have activated "Do not delete Update Package after Installation" the Update Package will be saved in the folder RCM Ultimate\Update\Packages\Date. Transfer this folder to another computer RDCM Server is installed on. Now you can install this Update Package by activating "Import Update Packages" and you have to choose the package below on Import Update Package.

Clicking on next the updates will be searched. You will be informed on possible updates and you can select which to install.

## 15.4 Info

Here you find the release version of RCM Ultimate.

## 16 Concluding remarks

We hope you enjoy RCM Ultimate. If you have any questions or any problems please contact us. Simply write an email to [support@rc-timing.ch](mailto:support@rc-timing.ch). Please do not forget to include the program name and the version number you are using. This will help us to answer your questions without any delay. If you are not known to us as a contact person of one of our customers, we should also know the contract number.

## A Appendix, the result sheet

Remark: The result sheet used here is based on decoder simulation. Therefore the values shown are not real. According to the program used the result sheet can vary, for example RCM Advanced does not support the record management.

Header: event, organiser, date and track

Racetime, section, weather conditions and time of the start

Average of the last (max. 6) laps of the driver

Corrections to the result

Best lap time of each driver

The best 10 drivers of the ranking list after this run

Survey of the records of the track and the day

Footnote with time of the printout and information of the organiser

Lap times for each driver

Result according to the used rule

Fußzeile mit Zeitangabe des Ausdruckes und Angaben zum Ausrichter.

Result publishing on internet	
Automatic (if internet connection available)	<input checked="" type="checkbox"/>
On MyRCM	<input checked="" type="checkbox"/>
Additional on other website	<input checked="" type="checkbox"/>
Cport to Mylaps	<input checked="" type="checkbox"/>

## **D Appendix, new features in RCM Ultimate version 1.4.16.174**

- 1 Transponder Logfile**  
In addition the Laps, laptime and absolute time will be displayed.
- 2. Championship Editor**  
You can define the procedure, how tied positions are handled.
- 3. Time schedule Editor**  
The positions in the time Schedule can be moved by drag&drop with the mouse. You can now select multiple lines and move these.
- 4. Decoder**  
A watchdog has been implemented. A message will be displayed, if the connection to the decoder is lost. Besides of that, the status of the connection is also displayed in the bottom line of RCM Ultimate.
- 5. Master/Slave/Remote Control**  
The master/slave connection has been improved a lot. Changes of frequencies, transponders, weather conditions, runtime and offtime will be directly transferred to the slave. The arrangement of the heats etc. (of course without the timekeeping data) can be transferred with "Tools/Transfer Database to Slave". The status of the master-slave connection is shown in the bottom line of RCM Ultimate under "Remote:".
- 6. Timekeeping**  
You can define, if the end of the race will be announced after the delay time or after all cars have finished the race. Further on you can set different announcements for the start with single- or groupstarts.
- 7. Reporte**  
Not started pilots can now be printed in the rankinglist for practice and qualification.
- 8. Other Improvements**  
The stability of all interfaces have been improved.
